EDITORIAL REVIEW OF THE VITAL STATISTICS OF MASSACHUSETTS: 1916.

I. BIRTH STATISTICS.

INTRODUCTION,	9-16
Source of data,	9
Birth registration,	9, 10
Live births,	10, 11
Stillbirths,	11
Changes in the birth rate,	11, 12
Birth rates of different parts of the State,	12, 13
Sex proportions at birth,	13, 14
Nativity of parents,	14, 15
Plural births,	15
Natural increase,	15, 16
STATISTICAL TABLES,	17-31
TABLE 1. — Live births, by sex and parent nativity; population; and birth rates in each county and municipality: 1916,	17-23
TABLE 2. — Live births by month of birth, plural births by sex, and stillbirths by sex and parent nativity in counties and in cities having over 50,000 inhabitants: 1916,	24, 25
TABLE 3. — Live births, by sex and parent nativity and sex proportion at birth: 1851 to 1916,	26
TABLE 4. — Live birth rates per 1,000 population, excess of births over deaths, natural increase per 1,000 population, plural births (cases of twins and triplets), and stillbirths by sex, per 1,000 live births, and sex proportions of stillborn: 1851 to 1916,	27
TABLE 5. — Live births and birth rates for the State, counties, and cities having over 100,000 inhabitants: 1870 to 1916,	28, 29
TABLE 6. — Birth rates in foreign countries and in Massachusetts: 1891 to 1915,	30
TABLE 7. — Natural increase in foreign countries and in Massachusetts: 1891 to 1915,	31

II. MARRIAGE STATISTICS.

INTRODUCTION,	35-38
Source of data,	35
Number of marriages and marriage rates,	35, 36
Marriages in counties,	36
Age at marriage,	36
First marriages and remarriages,	36-38
Nativity of persons married,	38
Months in which marriages were celebrated,	38

	PAGE
STATISTICAL TABLES,	39-57
TABLE 8. — Marriages, by nativity, and marriage rates in each county and municipality: 1916,	39-45
TABLE 9. — Marriages in counties and in cities having over 100,000 inhabitants, by months: 1916,	46, 47
TABLE 10. — Marriages in each county, by sex and age: 1916,	46, 47
TABLE 11. — Marriages, by sex and age: 1916,	48
TABLE 12. — First marriages, by sex and age: 1916,	48
TABLE 13. — First marriages of grooms and remarriages of brides, by age: 1916,	49
TABLE 14. — Remarriages of grooms and first marriages of brides, by age: 1916,	49
TABLE 15. — Remarriages of both parties, by age: 1916,	50
TABLE 16. — First marriages and remarriages: 1916,	50
TABLE 17. — Marriages, marriage rates, and nativity of persons married: 1870 to 1916,	51
TABLE 18. — Proportions of first marriages and remarriages per 1,000 marriages: 1901 to 1916,	52
TABLE 19. — Marriages of bachelors, maids, widowers, and widows, by age: 1901 to 1916,	53
TABLE 20. — Marriages and marriage rates in the State, counties, and in cities having over 100,000 inhabitants: 1891 to 1916,	54, 55
TABLE 21. — Marriages celebrated in each month and quarter: 1906 to 1916,	56
TABLE 22. — Marriage rates — persons married per 1,000 population — in foreign countries and in Massachusetts: 1891 to 1915,	57

III. DIVORCE STATISTICS.

INTRODUCTION,	61-65
Source of data,	61
Number of divorces,	61, 62
Divorce rates,	62, 63
Divorces in counties,	63
Party to which granted,	63
Causes of divorce, 1860 to 1916,	63, 64
Annulment classified as divorce,	64
Contested cases,	65
Applications for divorce,	65
Duration of marriage,	65
STATISTICAL TABLES,	66-86
TABLE 23. — Libels for divorces granted, refused, dismissed, contested, and not contested, and number of years libellants were married, by statutory causes and sex of libellant: The State — 1916,	66
A. Barnstable County,	67
B. Berkshire County,	68
C. Bristol County,	69
D. Dukes County,	70
E. Essex County,	71
F. Franklin County,	72
G. Hampden County,	73
H. Hampshire County,	74
I. Middlesex County,	75
J. Nantucket County,	76
K. Norfolk County,	77
L. Plymouth County,	78
M. Suffolk County,	79
N. Worcester County,	80

The Commonwealth of Massachusetts.

OFFICE OF THE SECRETARY, BOSTON, April 27, 1918.

To the Honorable Senate and House of Representatives.

I have the honor to submit herewith, as required by law, the seventy-fifth annual registration report, relating to the births, marriages, and deaths occurring in Massachusetts and registered in the several cities and towns during the year ending December 31, 1916, and containing also the reports relating to libels for divorce in the several counties, and the returns of deaths the causes and manner of which have been investigated by the medical examiners during the year 1916.

The method of presentation of the statistical data and the editorial review follow the same lines as the report for 1915, and were prepared by Mr. Frank S. Drown, Statistical Expert, United States Department of Labor, who also prepared the reports for the years 1914 and 1915. The report for 1916 consists of five parts:—

- I. Birth statistics, pages 7 to 31.
- II. Marriage statistics, pages 33 to 57.
- III. Divorce statistics, pages 59 to 86.
- IV. Mortality statistics, pages 87 to 237.
- V. Population statistics, pages 239 to 259.

The salient features of the vital statistics of 1916 are as follows:—

The birth rate in 1916 was 24.8 per 1,000 population, the lowest since 1882, and below the average for the sixty-five years from 1851 to 1915 (26.4). The falling off in the number of births registered in 1916 was particularly marked among the foreign-born population.

The marriage rate in 1916 was 18.2 per 1,000 population, being 1.2 above the rate for 1915 and .2 above the average (18) for the ten years from 1906 to 1915. The average rate for the sixty-five years from 1851 to 1915 was 18.9.

The divorce rate in 1916 was 153 per 100,000 married population, the same as for 1915, and an increase of 7 as compared with 1910.

The death rate in 1916 was 14.9 per 1,000 population, an increase over the rate of 14.4 for 1915. The average death rate for the preceding ten years from 1906 to 1915 was 15.5 per 1,000, and the average rate for the sixty-five years from 1851 to 1915 was 18.5. The increase in the death rate for 1916 was due chiefly to large increases in the number of deaths from organic diseases of the heart, measles, influenza, tuberculosis of the lungs, and infantile paralysis. (See page 101.)

The infant mortality rate in 1916 was 99.8 per 1,000 live births, the lowest ever recorded in this Commonwealth, the rate for the preceding year (1915) being 101.9, while the average for the ten years from 1906 to 1915 was 121.9. The reduction in the waste of infant life in recent years has been remarkable. In the nine years from 1908 to 1916 the increase in the number of babies born alive amounted to 7.6 per cent., while during the same period the number of infant deaths decreased 19.6 per cent. The actual number of deaths under 1 year of age was lower in 1916 (9,334) than in any year since 1889 (9,105), when the infant mortality rate was 159.5 per 1,000 live births. A high proportion of this salvage of infant life has taken place in Boston, where the infant welfare agencies have been very successful in their baby-saving campaigns. In Boston, during the nine years from 1908 to 1916 there was an increase of 6.8 per cent. in the number of live births, and a decrease of 13.7 per cent. in the actual number of deaths under 1 year. The infant mortality rate for the State outside Boston declined from 129.4 in 1908 to 98.6 in 1916, or 23.8 per cent., as compared with a decline in Boston from 148.8 in 1908 to 104.4 in 1916, or 29.8 per cent.

Mortality from several of the epidemic diseases was below the average. *The number of deaths from typhoid fever* (172) was the lowest on record, and the number of deaths from scarlet fever (127) was the lowest since 1851, except in 1905 (117) and 1912 (118). The number of deaths from diphtheria and croup (629) was the lowest, with the exception of four years (1909, 1911, 1912 and 1913), since 1867. The number of deaths from measles was greater than in any year since 1861, with the exception of two years (1872 and 1887). The death rate for this disease in 1916 was 10.4 per 100,000 population, as compared with 4.0 in 1915 and an average of 5.9 for the five-year period 1911 to 1915.

Cancer caused a larger number of deaths than in any preceding year, as did Bright's disease. The number of deaths from tuberculosis of the lungs (4,467) was greater than for any year since 1910 (4,503).

There were 7,028 deaths investigated by medical examiners in 1916, as compared with 6,516 in 1915. Autopsies were made in 791, or 11.3 per cent., of the examinations, as compared with 9.7 per cent. in 1915 and 11.4 per cent. for the ten years from 1907 to 1916.

Very respectfully,

ALBERT P. LANGTRY,

Secretary of the Commonwealth.

INTRODUCTION.

Source of Data. — The birth statistics presented in this report are compiled from data obtained by registration by physicians and midwives, who are required by statute² to report the name and place and date of birth to the clerk or registrar of the city or town in which the birth occurred within forty-eight hours after the birth of every child in cases of which they were in charge. The clerk of each city and town is also required³ to ascertain annually in January certain facts relative to all children born during the preceding year and resident therein.

*Birth Registration.*⁴ — The registration of births is intended to serve two purposes: (1) to identify the child and to establish its age and parentage, and (2) to furnish statistical data. Birth registration laws are based upon a public necessity, and were passed for the purpose of enabling citizens to produce competent proof of their

¹ For a list of the tables on birth statistics, see page iii.

² Acts of 1912, chapter 280.

³ Acts of 1910, chapter 93, section 2.

⁴ A list of references on birth registration was printed in the Seventy-fourth Annual Report on Births, Marriages, and Deaths in Massachusetts for 1915, pp. 22-24.

birth at times when such proof might be absolutely essential from a personal or property standpoint. Failure to report births may result in permanent injury to the child, inasmuch as this record affects his legitimacy, his enrollment in the army in time of war, the inheritance of property, the right to obtain an employment certificate, the right of franchise, the right to marry, the right of the widowed mother with dependent children to obtain a pension in those States which provide for mothers' pensions, or to prove citizenship in case of a visit to foreign countries. Birth registration by furnishing a record of children's ages enables the State to enforce its compulsory education laws, guaranteeing to each child an education. It enables the State to enforce its child labor laws, guaranteeing that education shall not be cut short by parents who would sacrifice the child, or by employers who would accept and encourage that sacrifice. Birth registration also enables the community to guard the newly born baby against blindness and those diseases which carry off so many babies in the first year of life, and leave so many crippled, maimed, and deformed, totally unable to become efficient social units. This record is just as important and just as sacred as a record of marriage.

An attendant at birth has not completed his task nor fulfilled his obligations to the child and its mother until he has reported the birth in the manner prescribed by law. Because of the many privileges accorded him by law and his prominent place in society, a duly licensed and registered physician should be one of the first in the community to realize the public benefits secured by compliance with the registration law, and he should be one of the first to assist in its enforcement.

Live Births. — The number of live births registered in 1916 was 93,487, an increase of 332, or .4 per cent., as compared with the number registered in 1915. There was a decrease in 1916 of 427, or .9 per cent., babies born of foreign-born parents. Among the native parents the number of births showed an increase of 646, or 2.1 per cent., while the births of mixed parents, *i.e.*, one parent native and the other foreign born, increased by 124, or .8 per cent., and the number of births of parents whose nativity was not reported on the birth certificate decreased by 11 (from 82 in 1915 to 71 in 1916). This decrease in the number of babies born of foreign-born mothers

was undoubtedly due to the decline in the foreign-born population, resulting from the virtually absolute stoppage of immigration since the outbreak of the European War, and also from the departure of some numbers of foreign born to their native land to participate in the war.

*Stillbirths.*¹ — The registered stillbirths in 1916 numbered 3,300, an increase of 139, or 4.4 per cent., as compared with 1915. The rate per 1,000 live births was 35.3 in 1916, as compared with 33.9 in 1915 and an average of 35.4 for the five years from 1911 to 1915.

Changes in the Birth Rate. — In proportion to the total population of both sexes and all ages the total live births were equivalent to a rate of 24.8 per 1,000 population. This rate was .4 per 1,000 below that recorded in 1915 and .8 per 1,000 below the average for the five years from 1909 to 1914. The birth rate per 1,000 married women of child-bearing ages, 15 to 44 years, was 188.8 in 1916, as compared with 193.0 in 1915.

The birth rate for the Commonwealth attained the highest point on record (30.2) in the year 1857. Since then the rate has fluctuated considerably, due to a decline in the birth rate of the native population, to an increase in the foreign-born population, and to variations in the completeness of birth registration.

Notwithstanding the improvement in birth registration, there has been a considerable decline in the birth rate since 1851. This decline has been most marked among the native population. The number of babies born to parents of foreign birth in 1916 was 43.6 per cent. greater than the number born to native mothers, as compared with 48 per cent. in 1915.

Although the birth rate has declined in recent years the infant death rate has also declined, so that the number of babies who survive the dangers of infancy is becoming steadily greater. This

¹ Acts of 1910, chapter 322, section 2 require that "a physician who has attended at the birth of a child dying immediately thereafter, or a physician or midwife who has attended at the birth of a child born dead, shall forthwith furnish for registration a certificate, stating that to the best of his or her knowledge and belief such child either died immediately after birth or was born dead. Both the birth and the death of such child shall be recorded and, if it was born dead, the word 'stillborn' shall be entered in both the record of birth and death." There is no precise definition of a stillbirth which the physicians or midwives are required to observe. The United States Children's Bureau, in its instructions to special agents (page 5) states that "the term stillborn shall not be applied to the issue of a pregnancy of less than seven months. The issue of shorter periods of gestation are to be designated 'miscarriages.'" The number of stillbirths registered is an understatement, as the registration of stillbirths is even less complete than that of live births.

fact is strikingly shown in Table 54, on page 142. A comparison in the data presented in this table with the birth rates shown of Table 4, on page 27, shows that while the birth rate per 1,000 population declined from 28.1 in 1851 to 24.8 in 1916, the number of babies per 1,000 population who survived the first year of life declined only from 24.3 in 1851 to 22.3 in 1916, and that the number of babies per 1,000 born alive who reached their first birthday increased from 867 in 1851 to 900 in 1915. Thus the decline in the birth rate during this fifty-six year period has been to a certain extent neutralized by the successful baby-saving campaigns which have been waged in recent years.

Birth Rates of Different Parts of the State. — The counties showing the highest birth rates in 1916 are: Hampden (29.4), Bristol (27.6), and Worcester (26.4). The lowest birth rates appear for Barnstable (18), Dukes (18.6), and Norfolk (19.1). These variations may be accounted for by the differences in the proportions of women and of married women of child-bearing age. Undoubtedly the rate for Suffolk County (25.9), and perhaps the rates for other counties and municipalities as well, are affected somewhat by the presence of hospitals to which many expectant mothers go from neighboring cities and towns in order to take advantage of the best medical advice and obstetrical care during pregnancy and childbirth.

New Bedford showed the highest birth rate (31) of the 7 cities having over 100,000 inhabitants, and was closely followed by Springfield (30.8) and Lowell (30.3). Of the 5 cities having between 50,000 and 100,000 inhabitants, Lawrence had the highest birth rate (31) and Somerville the lowest (22.4). Of the 30 cities having between 15,000 and 50,000 inhabitants, Chicopee had the highest birth rate (39.1), while Brookline had the lowest (11.7). Brookline had the lowest birth rate of any municipality in the State having over 7,000 inhabitants.

The high birth rates of certain communities may not be indicative of satisfactory increases in the population, since high rates of infant and childhood mortality may nullify the effect of high birth rates. New Bedford showed the highest birth rate (31) of the cities having over 100,000 inhabitants, but it also had a very high infant mortality rate (138.7). In other words, of every 1,000 babies born during the year only 861 lived until their first birthday. Fall River also had a

high birth rate (29.2), but only 826 babies out of every 1,000 born alive lived for twelve months. On the other hand, Cambridge showed the lowest birth rate (24.5) of the 7 cities having 100,000 or more inhabitants, but 911 out of every 1,000 babies born alive were still alive at the end of twelve months. Chicopee had the highest birth rate (39.1) of any municipality having over 15,000 inhabitants, but only 874 babies out of every 1,000 born alive survived for twelve months. Brookline had the lowest birth rate (11.7) of any municipality having over 7,000 inhabitants, but 961 out of every 1,000 babies born alive reached their first birthday. Similar data for municipalities having 15,000 or more inhabitants are presented in Table 52, on page 141.

Sex Proportions at Birth. — Throughout the civilized world there seems to be a tendency for more births of males than of females; but because of the higher mortality among males there is, in many places, particularly in the older sections of this country, an excess of females. It has never been adequately determined whether or not the proportion of masculine and feminine births is the result of definite causes. Dr. T. H. C. Stevenson, in his "Review of the Vital Statistics of England and Wales for the Year 1916"¹ makes the following interesting comment on the high proportion of male to female births (1,049 per 1,000) in that country: —

It will only be possible after the war, when the official statistics of all the countries concerned are published, to determine to what extent the old idea that war conditions lead to male conceptions has been justified by the huge experiment now in progress. It is, however, very interesting to note the support which the theory receives from the English figures even though the physical distress, characteristic of warfare, has not fallen upon our population. It can hardly be dismissed as an accidental coincidence that by far the highest proportion recorded during the last fifty years should have characterised the first calendar year entirely subject in this respect to the influences of war. . . . The extreme range during the last fifty years has been from 1,032 per 1,000 in 1898 to 1,043 in 1867 and 1875, and 1,049 in 1916.

Births of males in Massachusetts in 1916 numbered 48,256, and those of females 45,227. As compared with the previous year (1915) there was an increase of 470, or 1 per cent., in the number of male births, and a decrease of 136, or .3 per cent., in the number of female

¹ Seventy-ninth Annual Report of the Registrar-General of Births, Deaths, and Marriages in England and Wales, 1916, page xviii.

births. The ratio of male to female births was 1,067 in 1916, as compared with 1,053 in 1915. The corresponding proportions in each year since 1851 are shown in Table 3, on page 26. The extreme range has been from 1,036 males per 1,000 females in 1858 and 1889 to 1,098 in 1851.

Statistics of the variations in masculinity, as this excess of male births is termed, among the babies of native and foreign born mothers are not available for this Commonwealth, but studies of infant mortality made by the United States Children's Bureau in Johnstown, Pa.,¹ and Manchester, N. H.,² show an excess of female births among the babies of native mothers, — 993 males per 1,000 females in Johnstown, Pa., and 952 per 1,000 in Manchester, N. H.

The disparity between the sexes among the stillborn was considerably greater than among the live born, the ratio in 1916 being 1,436 males per 1,000 females, or 582 more male stillbirths than female. The corresponding proportions in each year since 1851 are shown in Table 4, on page 27. The extreme range has been from 1,842 males per 1,000 females in 1857 to 1,171 males per 1,000 females in 1901.

The extent to which the proportional excess in the number of boys at birth varies in the different municipalities may be calculated from the returns presented in Table 1, on pages 17 to 23. The relative extent of this excess varies from year to year in the different areas.

The ratio of males to 1,000 females of all ages in Massachusetts, according to the census of 1915, was 965, as compared with 967 in 1910.

Nativity of Parents. — The number of births where both parents were foreign born (45,920) exceeded the number of births where both parents were native (31,971) by 13,949, or 43.6 per cent., in 1916 as compared with 15,022, or 48 per cent., in 1915. Only in the rural counties of Barnstable, Berkshire, Dukes, Franklin, Nantucket, and Plymouth did the births of native parents exceed the births of foreign-born parents. The number of children born of mixed parentage in 1916 was 15,525, or 124 more than in 1915.

¹ Duke, Emma. *Infant Mortality: Results of a Field Study in Johnstown, Pa.* United States Children's Bureau, Publication No. 9, 1915, p. 43.

² Sheets, Beatrice Duncan, and Duke, Emma. *Infant Mortality: Results of a Field Study in Manchester, N. H.* United States Children's Bureau, Publication No. 20, 1917, p. 33.

The proportion of children born of native parents shows a general decrease from 1890 until about 1910, since when the proportion has steadily increased. In 1916 the proportion was 34.5 per cent., the highest since 1890, when it was 34.7.

The proportion of children born of parents one of whom was native and the other foreign born was 16.6 in 1916 as compared with 16.5 in 1915, but was less than in any other year during the period 1890-1915. The number of children born of parents whose nativity was not reported on the birth certificate was only 71 in 1916, the lowest number for any year except 1914 (70). Since 1892, when there were 443 births whose parent nativity was not reported, there has been a general decline, suggestive of an improvement in the accuracy of birth registration during that period.

Plural Births. — In 1916 there were 955 plural births, 942 pairs of twins, and 13 cases of triplets, or 10.1 pairs of twins per 1,000 live births and 13.9 cases of triplets per 100,000 live births. The frequency of twins in Massachusetts in sixty-six consecutive years from 1851 to 1916 numbered 9.8 per 1,000 live births, and the frequency of triplets in the same period numbered 11 per 100,000 live births.

Natural Increase. — The excess of the birth rate over the death rate shows the ratio at which the community is reproducing itself by natural increase. In 1916 the birth rate was lower and the death rate was higher than in 1915, and the natural increase amounted to 9.9 per 1,000 population, as compared with 10.8 in 1915 and an average of 10.4 for the five years 1910 to 1914. Comparisons of the natural increase from 1851 to 1916 can not be made with absolute accuracy from the data shown in Table 4, on page 27, on account of the defective birth registration in the earlier years. Since 1850 the natural increase has fluctuated between 1.4 in 1864 to 12.0 in 1857 and 1859. Since 1881 the natural increase has more than doubled.

Those who view with apprehension the decline in the birth rate may take comfort from the fact that the births in this State are far in excess of the deaths. The excess was as great as 65.9 per cent. in 1916 (as compared with 43 per cent. in 1915). The population of the Commonwealth would, therefore, show a healthy increase from decade to decade if the present birth and death rates were to remain substantially unchanged, even though immigration should decrease.¹

¹ See also discussion of survivorship on page 12.

The distribution throughout the Commonwealth of the natural increase in 1916 may be calculated from the birth rates shown in Table 1, on pages 17 to 23, and the death rates shown in Table 33, on pages 110 to 117. Table 52, page 141, shows the natural increase for municipalities having over 15,000 inhabitants in 1915. Among these communities the natural increase varied from .3 per 1,000 in Northampton to 25 per 1,000 in Chicopee.

¹ Compiled from annual reports of the Registrar-General of England and Wales, annual reports on births, marriages, and deaths for Massachusetts, and United States Bureau of the Census report on birth statistics, 1915.

² Average for 4 years, 1906 to 1909.

³ Rate for 1915 for the birth-registration area comprising the six New England States, New York, Pennsylvania, Michigan, Minnesota, and the District of Columbia, with an estimated population of 31,150,803, representing 31 per cent. of the total for the United States.

⁴ Provisional birth-registration area comprising the six New England States, Pennsylvania, Michigan, the District of Columbia, and New York City.

INTRODUCTION.

Source of Data. — The original information from which marriage statistics are derived is obtained by the registration of marriages, the purpose of this registration being largely to protect the home and the family, and to furnish reliable evidence upon which to base the legitimacy of children and the dower rights of women.

Number of Marriages and Marriage Rates. — The marriages registered in Massachusetts during the year 1916 numbered 34,386, corresponding to a rate of 18.2 persons married per 1,000 population at all ages. This rate was 1.2 above the rate for 1915, and .1 above the average rate (18.1) for the decade 1905 to 1914. The number of marriages in 1916 was 3,085 more than the number registered in 1915, and 1,798 more than the number registered in 1914, which was the record year up to that time. The proportion of persons married per 1,000 population during the sixty-six years 1851 to 1916 has ranged between a maximum of 24.8 in 1854 and a minimum of 14.9 in 1878, the average annual rate for the whole period being 18.9. In 1916 the marriage rate for males was 18.6 per 1,000 male population, and the rate for females was 17.9 per 1,000 female population.

The more accurate method of measuring the marriage rate is to eliminate married persons and young children, and to calculate the rate on the unmarried, widowed, and divorced population of mar-

¹ For a list of the tables on marriage statistics, see page iv.

riageable age, usually those over 15 years of age. By this method we deal only with that section of the population in which marriages take place. In 1910 the number of persons married per 1,000 unmarried population 15 years of age and over was 51.8, which means that in that year something over 5 per cent. of the adult unmarried population married. This marriage rate for 1910 was 2.4 per 1,000 higher than the rate of 49.4 for 1900. The marriage rate for 1916, based on the estimated unmarried population 15 years of age and over, was 54.0, as compared with 50.0 in 1915 and 53 in 1914.

Marriages in Counties. — The counties having the highest marriage rates — persons married per 1,000 population — in 1916 were: Suffolk (22.0), Nantucket (21.1), and Plymouth (20.6), while those having the lowest rates were Franklin (13.9) and Norfolk and Dukes (14.0 each). The rate for Suffolk County is probably affected in some degree by the number of marriages of nonresidents who come to Boston for that purpose. No attempt has been made to compute the marriage rates of communities on the basis of the residence of the parties married.

Age at Marriage. — Two out of every five persons married were between the ages of 20 and 25 years; 37.3 per cent. of the grooms and 44 per cent. of the brides. Twenty-two per cent. of the marriages took place between males and females both between 20 and 25 years of age; 16 per cent. took place between males 25 to 29 years of age and females 20 to 24 years of age; 11.1 per cent. took place between males 20 to 24 years of age and females under 20 years of age.

Under the age of 20 years there were 882 grooms, or 2.6 per cent., of all the men married, and 5,956 brides, or 17.3 per cent., of all the women married. At the other extreme of life, above 60 years, were found 370, or 1.1 per cent., of all the men married, and 109, or .3 per cent., of all the women married.

First Marriages and Remarriages. — Marriages between bachelors and maids formed 85.3 per cent. of the 34,386 marriages which took place in 1916; marriages between widowers and maids formed 6.1 per cent.; marriages between bachelors and widows, 4.6 per cent., and marriages between widowers and widows, 4.1 per cent. These proportions for 1916 correspond very closely with the proportions in 1915 (85, 6.4, 4.2, and 4.1 per cent., respectively).

About one-fourth (25.8 per cent.) of the marriages between bachelors and maids were between bachelors 20 to 24 years of age and maids 20 to 24 years of age; 17.9 per cent. were between bachelors 25 to 29 years of age and maids 20 to 24 years of age; 12.9 per cent. were between bachelors 20 to 24 years of age and maids under 20 years of age.

Forty-one per cent. of the 30,893 bachelors who were married in 1916 were 20 to 24 years of age; 34.4 per cent. were 25 to 29 years of age; 12.7 per cent. were 30 to 34 years of age.

Forty-eight per cent. of the 31,404 maids who were married in 1916 were 20 to 24 years of age; 21.4 per cent. were 25 to 29 years of age; 18.9 per cent. were under 20 years of age.

Seventeen per cent. of the 3,493 widowers who were married in 1916 were 35 to 39 years of age; 14.9 per cent. were 40 to 44 years of age; 14 per cent. were 30 to 34 years of age; 12.5 per cent. were 45 to 49 years of age.

Nineteen per cent. of the 2,982 widows who were married in 1916 were 25 to 29 years of age; 18.2 per cent. were 35 to 39 years of age; 18.1 per cent. were 30 to 34 years of age.

One-fifth (20 per cent.) of the 2,081 widowers who married maids were 35 to 39 years of age; 17.8 per cent. were 30 to 34 years of age. Of the 2,081 maids who married widowers, 23.5 per cent. were 20 to 24 years of age; 23.2 per cent. were 25 to 29 years of age. The largest number of marriages between widowers and maids (169, or 8.1 per cent.) was between widowers 25 to 29 years of age and maids 20 to 24 years of age.

Twenty-eight per cent. of the 1,570 bachelors who married widows were 25 to 29 years of age; 22.5 per cent. were 30 to 34 years of age. Of the 1,570 widows who married bachelors, 27.8 per cent. were 25 to 29 years of age; 22.7 were 30 to 34 years of age. The largest number of marriages between bachelors and widows (205, or 13.1 per cent.) was between bachelors 25 to 29 years of age and widows 25 to 29 years of age.

Seventeen per cent. of the 1,412 widowers who married widows were 40 to 44 years of age; 15.6 per cent. were 50 to 54 years of age; 14.7 per cent. were 45 to 49 years of age. Of the 1,412 widows who married widowers, 18.5 per cent. were 35 to 39 years of age; 18.3 per cent. were 40 to 44 years of age; and 14.4 per cent. were 45 to 49 years of age. The largest number of marriages between

widowers and widows (84, or 5.9 per cent.) was between widowers 40 to 44 years of age and widows 40 to 44 years of age.

Ninety per cent. of 34,386 men who were married in 1916 were married for the first time; 3,272, or 9.5 per cent., were married for the second time; 212, or .6 per cent., for the third time; and 9 for the fourth time. Ninety-one per cent. of the 34,386 women who were married in 1916 were maids; 2,854, or 8.3 per cent., were married for the second time; 126, or .4 per cent., for the third time; and 2 for the fourth time.

Nativity of Persons married. — Both the bride and groom were native in 47 per cent. of the marriages which took place in 1916; in 33.3 per cent. both parties were foreign born; in 10.3 per cent. the groom was foreign born and the bride native; and in 9.3 per cent. the groom was native and the bride foreign born. The proportion of marriages in which the groom was native and the bride foreign born has declined in recent years; the proportion of marriages in which both parties were foreign born has increased; and the proportions in which both parties were native and in which the bride was native and the groom foreign born have shown but little change.

Months in which Marriages were celebrated. — The largest number of marriages were celebrated in June, 4,792, or 13.9 per cent. of all the marriages in 1916 taking place during that month. Since the months are not of equal length, the monthly incidence must be reduced to a uniform basis. The average daily number of marriages for 1916 was 94. The months showing a higher average than that for the year were: June (160), October (133), November (121), September (120). The months showing a lower average than that for the year were: July (87), February (85), May (83), August (79), January (76), April (71), December (67), March (51).

INTRODUCTION.

Source of Data. — The data concerning divorce presented in this report are obtained annually from the clerks of courts for the several counties, and from the clerk of the Supreme Judicial Court for the county of Suffolk, on forms prescribed by the Secretary of the Commonwealth.

Number of Divorces. — Divorces granted in 1916 numbered 2,301, an increase of 49, or 2.2 per cent., over the number granted in 1915, and an increase of 173, or 8.1 per cent., over the average number granted for the five-year period 1911 to 1915. In the fifty-seven years from 1860 to 1916 the number of divorces granted was 55,168. In the twenty-eight years from 1860 to 1887 the number was but 12,596, less than one-third (31 per cent.) of the number recorded in the last half of the fifty-six-year period 1860 to 1915. Each successive five-year period since 1860, with the single exception of the period 1880 to 1884, has witnessed a marked increase in the number of divorces, as is shown in Table 25 on page 81.

A comparison of the increase in divorce with the increase in population is shown in Table 26, on page 82. In the quinquennium

¹ For a list of the tables on divorce statistics, see pages iv and v.

1865 to 1870 the rate of increase for population was 15 per cent., and for divorce 13.8 per cent. In the succeeding quinquennium, 1870 to 1875, the population increased 13.4 per cent., while the rate for divorce increased 52.2 per cent. In the half decades 1875 to 1880 and 1885 to 1890 the increase in population was greater than the increase in divorce, but since 1890 the rate of increase in divorce has been very much greater than the rate of increase in population. The difference in the relative size of the two rates of increase was greatest in the quinquennium 1870 to 1875 and 1890 to 1895, when the rate of increase in divorce was nearly four times the rate of increase in population.

*Divorce Rates.*¹ — The number of divorces per 100,000 population in 1916 was 60.9, as compared with 61.0 in 1915, 60.4 in 1914, 57.3 in 1910, 29.2 in 1890, and 26.0 in 1870. Each census year since 1890 shows a marked increase over the preceding census year.

The movement of divorce as shown by the two sets of rates (per 100,000 total population and per 100,000 married population) is nearly the same. Based on the married population, the divorce rate in 1915 was 80 per cent. greater than it was in 1875, and the increase as shown by the rate based on the total population was 85 per cent. Based on the estimated married population, the divorce rate for 1916 was 153 per 100,000.

The rapidity with which marriages are being dissolved by divorce is measured by the divorce rate based on the married population. In 1910 the rate was 146 divorces per 100,000 married persons; in 1916 the rate was 153, or about 1.5 divorces per 1,000 married persons. Were it not for absentee husbands and wives 1,000 married persons would represent exactly 500 married couples, but it is probable that this number represents only approximately 500 married couples. During the period 1910 to 1916 divorce was dissolving each year about 3 marriages (2.9 in 1910 and 3.1 in 1916) out of every 1,000 in existence. In the five-year period 1873 to 1877, represented by the figures for 1875, divorce was dissolving each year 1.7

¹ Divorce rates based on the married population, *i.e.*, the number of divorces per 100,000 married population, are more significant than rates based upon the total population, because of the elimination of possible variations in the proportion married, and because of the fact that divorce can arise only among the married. Rates calculated in this manner are shown in Table 27, on page 82, for the census years 1875 to 1915, and on the estimated married population for 1916. In this table the number of divorces shown for the census years 1875 to 1910 is not the actual number in that year, but the annual average for the five-year period of which the census year is the median year. This method eliminates any peculiarities in the census year which may have affected divorce, and makes the figures more typical of the period as a whole.

marriages out of every 1,000 in existence. For 1890 the ratio was 1.7 out of every 1,000; for 1900, 2.5 out of every 1,000.

Divorce in Counties. — The wide variations in the divorce rates in the different counties shown in Table 28, on page 83, are not easily accounted for, as the results may be affected by a great variety of influences, among some of the more important of which may be mentioned: (1) the composition of the population as regards race or nationality; (2) the proportion of immigrants in the population and the countries from which they came; and (3) the relative strength of the prevailing religions, and particularly the strength of the Roman Catholic faith.

Party to which granted. — Over two-thirds (70.4 per cent.) of the total number of divorces in the period 1860 to 1916 were granted to the wife. In other words, divorces obtained by the wife are more than twice as numerous as those obtained by the husband. This difference may be partially explained by the fact that without any reference to the question of which party is the more frequently responsible for the marital unhappiness that leads to divorce, the wife has a legal ground for divorce more frequently than the husband. Although the law makes no distinction between the parties to a marriage in respect to the grounds on which a divorce may be granted, certain well-known and comparatively common grounds are more readily applicable against the husband than against the wife. Notably there is nonsupport, which, for the husband seeking divorce, is not ordinarily an available ground. Again, cruelty, although not infrequently the ground for divorces granted to husbands, is, at least so far as it is physical cruelty, more often existent as a cause for the wife's seeking a divorce.

The proportion of divorces granted to the wife fluctuated between 75.6 per cent. in 1876 and 56.4 per cent. in 1866, as compared with 70.4 per cent. for the entire period 1860 to 1916.

Cause of Divorce, 1860 to 1916. — The statistics concerning the cause of divorce deal with the legal cause as ascertained from the court records. It should be borne in mind, however, that the cause for which a divorce is granted by the courts is very often not the underlying cause of the marital unhappiness. The legal causes of divorce are shown for the period 1860 to 1916 in Table 29, on page 83, and for each year of that period in Table 30, on page 84.

Divorces granted on the ground of desertion have increased more

than ninefold in the fifty-seven-year period 1860 to 1916, while the number of divorces granted for adultery have about doubled. With the addition of new grounds for divorce to the statute books, there appears to have been a reduction in the actual number of divorces for adultery. (See Table 30, on page 84.)

The most commonly assigned ground for divorce was desertion, which accounted for 46.4 per cent. of all the divorces granted in the period 1860 to 1916; for 57.7 per cent. of those granted to the husband in this period; and for 41.6 per cent. of those granted to the wife.

The substantially equal number of divorces granted for adultery to the husband and to the wife is rather striking. In 10,953 divorces granted for adultery, the divorce was granted to the husband in 50.3 per cent. of the cases and to the wife in 49.7 per cent.

Of the divorces granted to husbands, 57.7 per cent. were for desertion of the wife, and 33.8 per cent. were for adultery on the part of the wife; and of those granted to wives, 41.6 per cent. were for desertion of the husband and 21.1 per cent. were for cruelty on the part of the husband.

Intoxication as a ground for divorce figured in 11.6 per cent. of the divorces granted during the period 1860 to 1916, and of this number, 14.6 per cent. were granted to the husband and 85.4 per cent. to the wife. Divorces granted for this cause formed 5.7 per cent. of all divorces granted to the husband and 14.1 per cent. of the total number granted to the wife.

During the fifty-seven years from 1860 to 1916 the relative importance of these different causes for divorce has undergone considerable change. The sudden variations noticeable in Table 30 are due in large part to changes in the laws concerning divorce.

Annulment classified as Divorce.—Among the less important classes of causes appears the term “nullity of marriage.” Table 29, on page 83, shows that in 297 cases, or .5 per cent. of the total number of divorces granted during the period 1860 to 1916, there was some cause shown which may have existed at the time of the marriage. Although it may be open to question how far such causes are to be regarded as causes for true divorce, they have been included in the statistics of this report. These cases form but a small proportion (.5 per cent.) of all cases considered, and do not affect the results to any material degree.

Contested Cases. — Of the total number of applications for divorces during the thirty-five years from 1882 to 1916, the data presented in Table 31, on page 85, show that only 11.6 per cent. were contested; and probably in many of these cases the contest was hardly more than a formality, perhaps not extending beyond the filing of an answer, which often has the effect of expediting the process of obtaining the divorce.

Applications for Divorce. — The courts grant about three petitions out of every four filed, as shown in Table 31, on page 85. This proportion fluctuated considerably during the period 1882 to 1916, the highest proportion of applications being granted in 1900 (89 per cent.), and the lowest proportion in 1888 (51.1 per cent.). During this entire period 76.3 per cent. of all applications were granted, 1.9 per cent. were refused, and 21.8 per cent. were dismissed.

Duration of Marriage. — The average number of years libellants were married at the time of application for divorce has fluctuated between 10.5 years in 1891 and 1912, and 11.7 years in 1884, 1887, and 1892. The average number of years the libellants were married in 1916 was 10.6, as compared with 10.7 years in 1915. Table 32, on page 86, shows for the thirty-five years from 1882 to 1916, the number of years the libellants were married at the time of application for divorce, exclusive of those for which the duration of marriage was unknown, but does not show the number of years the persons whose divorces were actually granted were married, as data relative to the latter question were not tabulated. The material shown in Table 32 is also incomplete for the reason that for the years 1882 to 1892 the number of libels which were dismissed was not tabulated.

Of the total libellants in Massachusetts for whom the number of years married was reported in 1916, 54.3 per cent. made application for divorce before they had been married ten years, as compared with 52.3 per cent. in 1915 and 51.3 per cent. for the thirty-five-year period 1882 to 1916.

STATISTICAL TABLES.

INTRODUCTION.

A. General Mortality.

Source of Data. — Mortality statistics are based upon original data obtained by the registration of deaths, which is accomplished by the use of a blank or schedule known as a death certificate. The responsibility for seeing that a certificate is properly made out and filed with the board of health or its agent rests primarily with the undertaker. The board of health is required to transmit the certificate to the city or town clerk.²

¹ For a list of the tables on mortality statistics, see pages v to vii.

² Revised Laws, chapter 29, section 12.

Death Registration. — The functions of death registration are legal, economic, and social. Death registration is useful in preventing and detecting crime through the restrictions placed upon the disposal of dead bodies. It serves as evidence in the inheritance of property and in the settlement of life insurance contracts and policies. It also permits health officers to attack epidemics in their incipency by indicating that preventable diseases are causing undue numbers of deaths and showing the exact location of such undue mortality, the ages and classes of persons affected, and the relation of the diseases to season, race, sex, poverty, and other conditions.

*Number of Deaths and Death Rates.*¹ — There was an increase in the mortality of 1916 from that of 1915, the number of deaths occurring during the calendar year 1916 being 56,366, or an increase over 1915 of 3,235. Based on the estimated midyear population of 3,775,720, these deaths correspond to a rate of 14.9 per 1,000 population. This rate is higher than the death rate in 1915 (14.4) and in 1914 (14.5), the same as in 1912 and 1913 (14.9), but is lower than for any year prior to 1912.

During the first sixteen years of the present century the crude death rate of Massachusetts has fallen from 18.2 per 1,000 in 1900 to 14.4 in 1915 and 14.9 in 1916. This remarkable decrease in mortality has been the rule rather than the exception in the experiences of the American States and of many foreign countries.² Since 1851 the average death rate for Massachusetts has been 18.5 per 1,000 living, as compared with 14.9 in 1916. During the period 1871 to 1875 this rate stood at 20.9, and as recently as 1896 to 1900, at 18.1, since which time the fall has been fairly rapid.

¹ Crude death rates are expressed in terms of the number of deaths per 1,000 population, or in some instances per 10,000 or 100,000, and are calculated by dividing the total number of deaths by the population in thousands. Crude death rates are of value for showing the numerical loss of the population by death, for comparing the death rates of the same community for a number of years, and for comparing the death rates of different communities having populations of similar compositions as to sex and age, etc. For populations of different sex and age compositions the comparison of crude death rates leads to erroneous conclusions, for the reasons that the death rates of women are usually lower than those of men, and the death rates of the several age groups vary within wide limits. Other factors which seriously affect the comparability of the death rates of different communities are: (1) the race composition of the population; (2) the social, marital, and economic status of the people; (3) the nature and conditions of employment; (4) the location of hospitals and institutions; (5) migration; and (6) the birth rate. Some of these disturbing factors may be overcome by the use of what are known as specific and standardized death rates. In 1895 the International Statistical Institute recommended that to facilitate the comparison of death rates of different countries, the population of Sweden as it existed in 1890 be used as a standard population for the statement of rates. This system standardizes for age, while the system used by the Registrar-General of England and Wales, based on the population of England and Wales as shown by the 1901 census, standardizes for both age and sex.

² See Tables 48 and 49, on pages 137 and 138.

Table 36, on page 126, shows the number of deaths and the death rates per 1,000 population for the census years, and per 1,000 estimated population for the intercensal years from 1851 to 1916.

Sex. — Of the 56,366 deaths in 1916, 29,536, or 52.4 per cent., were males, as compared with 52 per cent. in 1915. In 7 cases the sex of the decedent was unknown or not reported. The proportion of males in the living population in 1915 was 49.1 per cent. Expressed as a ratio there were 1,101 deaths of males per 1,000 deaths of females in 1916, as compared with 1,060 in 1915, 1,085 in 1914, and 1,077 for the five years from 1909 to 1913.

Table 37, on page 127, presents the number of deaths distributed by sex and the ratio of the mortality among the males to that among the females for each year from 1860 to 1916, and the death rates for each sex and the excess of the male death rate over the female death rate for the census years 1860 to 1915. Reference to this table shows that in 1865, undoubtedly as a result of the civil war, the death rate for males was 2.1 greater than the death rate for females, and in 1870 the rate for males exceeded that for females by only .9 per 1,000. Since 1875, however, although the death rates for both males and females have steadily declined, the difference between the death rates of the sexes has fluctuated considerably, reaching the maximum in 1905, when the difference was 1.9 per 1,000, declining in 1910 to 1.8 per 1,000 and increasing in 1916 to 1.9 per 1,000. An almost steady increase in the proportion of male to female deaths, particularly from 1878 to 1916, with a slight decrease in 1914 and 1915, are shown in the same table.

Table 38, on page 128, shows the causes of death which mainly account for the difference in mortality between the sexes. The excess of the mortality of males was greatest from violence and tuberculosis of the lungs.

The excess in the mortality of males from all causes during the first year of life in 1916 amounted to 31.1 per 1,000 population.

Age. — Of the 56,366 deaths in 1916, 9,334, or 16.6 per cent., were of infants under 1 year of age, as compared with 17.9 per cent. in 1915 and an average of 19.7 per cent. for the five years from 1910 to 1914. A more detailed discussion of infant mortality may be found on pages 95 to 99.

The ages at which the people have been most benefited by reduc-

tions in death rates are illustrated in Table 39, on page 129, which shows the number of deaths and the death rates per 1,000 population for the census years 1875 to 1915. While the death rates for the lower ages have decreased in recent years, the death rates of persons 50 years and upwards have increased. In the forty years covered by this table the death rate of infants under 1 year of age declined from 226.6 to 126.1 per 1,000 population under 1 year of age; the death rate of children under 5 years of age declined from 74.0 to 35.5 per 1,000; and so on for all age periods up to 50 years. Above the age of 50 years the death rate in 1910 was very much higher than in 1875. The decrease in the death rate for all ages, and in the rates due to diseases most frequent in the early years of life, on the one hand, and the increase in rates for the advanced ages, on the other, indicate increased longevity.

The proportion which deaths of certain ages form of all deaths for the period 1872 to 1916 is shown in Table 40, on page 130. There has been a steady decline in the proportion of deaths under 1 year, under 5 years, and from 20 to 29 years, with a corresponding steady increase in the proportion of deaths at all other ages.

Sex and Age. — The death rate of adult males we should naturally expect would be greater than the rate for adult females, on account of the more dangerous occupations of the males, but the excess in the death rates of male infants as compared with female infants has never been satisfactorily explained. Of the 9,334 decedents under 1 year of age, 5,303 or 56.8 per cent., were males. The ratio of male to female deaths among the higher age periods fluctuated somewhat; the proportion of male deaths was always the larger from 1 year of age to the age period 65 to 69 years. From the age of 70 years and upwards the number of deaths of females exceeded the deaths of males. In the total population in 1915 the number of males was in excess of the number of females up to the age of 14 years; from that period on the excess of females was marked, particularly so beginning with the age period 50 to 54 years, when the excess increased greatly with the increase of age. The ratios of male deaths per 100 deaths of females at the various age periods in the three years 1914 to 1916 are shown in Table 41, on page 130.

The excess of females in the population 65 years of age and over

is so great, that, even though their mortality at each age period is below that of males, the absolute number of deaths is greater. Among the 29,536 male decedents in 1916, 5,303, or 18 per cent., were under 1 year of age; among the 26,823 female decedents, 4,031, or 15 per cent., were under 1 year; and among the decedents of both sexes, 16.6 per cent. were under 1 year. (See Table 42, on page 131.)

Marital Condition. — Nearly one-half (47.1 per cent.) of the decedents 15 years of age and over whose marital condition was reported in 1916 were married, 21.3 per cent. were single, and 31.5 per cent. were widowed and divorced. Among the male decedents 53.7 per cent. were married, 24.1 per cent. were single, and 22.1 per cent. were widowed and divorced. Among the female decedents 40.3 per cent. were married, 18.4 per cent. were single, and 41.3 per cent. were widowed and divorced. No precise study of the bearing of marital condition on mortality statistics can be made, however, without a detailed statement of the age distribution of the population, which was not available until after this report was prepared. Table 45, on page 134, shows the number of deaths of males and females 15 years of age and over, by marital condition.

Centenarians. — Among the deaths registered during 1916 there were 21 of reputed centenarians, 12 of whom were females; 10 were native and 11 were foreign born; 20 were widowed and 1 was married. Table 43, on page 132, presents data concerning the deaths of centenarians in 1916; and Table 44, on page 133, shows the number of deaths of centenarians by sex, nativity, marital condition, and maximum age at death for the thirty-six years 1881 to 1916.

Urban and Rural Districts. — There has been a greater decline in the death rate of urban areas than of rural areas in Massachusetts during the period 1910 to 1915. It should be borne in mind, however, that the urban population is increasing, while the rural population is relatively stationary, and also that it is largely increase of population, particularly of persons of the younger ages, that lowers a death rate. Death rates for cities and rural districts of Massachusetts compiled from the mortality reports of the United States Bureau of the Census are shown in Table 46, on page 135. While these death rates are not strictly comparable with others presented in this report, owing to the different method used by the United

States Bureau of the Census in estimating population from that used in this report, they have been compiled on a uniform basis and may therefore be used to compare one year with another in the same community.

Nativity. — Nearly two-thirds (66.3 per cent.) of the decedents whose nativity was reported on the death certificates in 1916 were native. There were 465 decedents whose nativity was not reported on the death certificates. The close correspondence between the nativity of decedents (67.6 per cent. native in 1915) and the nativity of the total population is shown by the census of 1915, 68.8 per cent. of the population of the Commonwealth at that time being native. The death rate among the native population (estimated) in 1916 was 14.4 per 1,000; among the foreign born it was 15.8.

Seasonal Distribution of Deaths. — The largest number of deaths during any month occurred in January (6,124), and the next largest number in March (5,335), the latter being usually the most unfavorable month as measured by mortality. Since the months are not of equal length, the monthly incidence must be reduced to a uniform basis. The average daily number of deaths for 1916 was 154. The months showing a higher average than that for the year were: January (198), February (179), March (172), December (162), and April (157). The months showing a lower average than that for the year were: July (124), June (132), August and October (140 each), September (146), November (147), and May (152). Table 47, on page 136, shows the number of deaths in each month in 1916 in the State, in each county, and in municipalities having over 50,000 inhabitants.

The increase in the number of deaths in 1916 over 1915 was greatest in the cold months of January, February, November, and December. January showed the greatest increase — 50 a day. April showed a reduction of 19 a day, May of 11 a day.

High winter, and more especially spring mortalities have occurred in this State in recent years, and may be attributed in a considerable degree to the deaths from pneumonia and other acute respiratory disease mortalities, and also diseases of the nervous and circulatory system. Deaths from these causes have greatly affected the mortality of advanced age, and, to a lesser degree, that of early life.

Deaths from diseases of the nervous system in the winter and spring months of 1916 numbered 90, or 3.2 per cent. more than those

which occurred in the summer and autumn months. The corresponding excess in 1915 was 431, or 18 per cent. The decrease in the percentage of excess in 1916 as compared with 1915 was due to the epidemic of infantile paralysis* in the summer and autumn of 1916, there being 434 deaths from this cause during the summer and autumn months as compared with only 18 deaths in the winter and spring months. Deaths from diseases of the circulatory system in the winter and spring months of 1916 numbered 1,444, or 29.8 per cent. more than in the summer and autumn months; while deaths from diseases of the respiratory system numbered 3,875, or 194.5 per cent. more. Bright's disease* and acute nephritis are also diseases of cold weather mortality; 55.0 per cent. of the 3,490 deaths from these causes occurred during the winter and spring months of 1916, as compared with 62.8 per cent. in 1915. Tuberculosis of the lungs* caused 4,467 deaths in the twelve months, and of these, 2,505, or 56.1 per cent., occurred during the winter and spring months of 1916, as compared with 62.8 per cent. in 1915.

B. Infant Mortality.

The enormous waste of infant life that is going on is shown by the fact that 1 baby out of every 10 born alive dies before reaching its first birthday. The death rate of infants under 1 year of age was over ten times as high as at all other ages of childhood and adult life, as measured by the ratio of deaths to the estimated living population in both age groups.¹ Of the 56,366 deaths registered in Massachusetts during 1916, 9,334, or 16.6 per cent., were those of infants under 1 year of age, corresponding to a mortality rate of 99.8 per 1,000 live births. The conditions which destroy so many of the youngest lives are certain to react unfavorably upon the health of the entire community, and often result in crippling and maiming those who do survive the first year in a manner such as to forever handicap them in becoming efficient social units.

The infant mortality rate of 99.8 per 1,000 live births is the lowest ever recorded for this Commonwealth, and is 22.1 per 1,000 live births, or 18.1 per cent. below the average (121.9) for the preceding

* Acceptable statement of cause of death without autopsy. See pages 263-267.

¹ This comparison is probably approximately correct, although the returns of all censuses of population under 1 year of age are somewhat unreliable, owing to the carelessness of parents in reporting as "one-year old" babies within a few months under or over that age.

ten years, 1906 to 1915. This reduction is partly the result of a decline in the rate of diarrheal* mortality and a decrease in the mortality from developmental and wasting diseases,* such as premature birth* and congenital malformations.* The decline in the infant mortality rate has been continuous since 1905 with the exception of two years (1908 and 1910). This remarkable salvage of the lives of babies in recent years has been due not so much to the gradual improvement in birth registration¹ but to an actual reduction in the number of deaths under 1 year of age. In the nine years from 1908 to 1916 there has been *an increase of 7.6 per cent. in the number of live births registered and a decrease in the actual number of deaths under 1 year of 19.6 per cent.* In fact, the actual number of deaths under 1 year of age was lower in 1916 (9,334) than in any year since 1890 (9,625), when the infant mortality rate was 166.6 per 1,000 live births.² The figures for each year in this remarkable record of reduction in infant mortality are shown in Table 50, on page 139.

A high proportion of the salvage of infant life in Massachusetts has taken place in Boston, where the infant welfare agencies have been untiring in their baby-saving campaigns. In 1916 deaths under 1 year of age numbered 2,046, or 104.4 per 1,000 live births, a slight increase over the rate of 103.8 in 1915, which was the lowest on record. In the nine years from 1908 to 1916 there has been an increase of 6.8 per cent. in the number of live births registered, and a decrease in the actual number of deaths under 1 year of 13.7 per cent. For the remainder of the State the number of births registered increased 7.8 per cent. during this period, while the number of deaths under 1 year decreased 17.9 per cent. The infant mortality rates for the State exclusive of Boston decreased from 129.4 in 1908 to 98.6 in 1916, or 23.8 per cent., as compared with a decrease in Boston from 148.8 in 1908 to 104.4 in 1916, or 29.8 per cent. (See Table 53, on page 142.)

The infant mortality rates in municipalities having 15,000 or more inhabitants for the years 1910 to 1915 are shown in Table 51, on

¹ The increase in the completeness of birth registration is responsible for a share in the decline of the infant mortality rate. An increase in the divisor (the number of registered live births) caused by the increase in the completeness of birth registration, at the same time that the dividend (the number of deaths under 1 year of age) remains the same, will manifestly result in a decrease in the quotient (the infant mortality rate).

² The largest number of infant deaths (11,765) since 1851 occurred in 1896, and the next largest number (11,606) in 1908, twelve years later.

page 140. Nearly all of these municipalities show decreases in infant death rates.

It should be borne in mind that the infant mortality rates of cities in which children's hospitals and maternity hospitals are located are often very misleading. For example, in Holyoke during the year ended September 30, 1916, 292 babies died under 1 year of age, corresponding to an infant mortality rate of 182 per 1,000 live births. But of the 292 babies dying in Holyoke, 104 were born in cities outside of Holyoke, and were brought, many of them in moribund condition, to the Brightside Institution. Of the 104 babies, Worcester sent 38, Springfield 15, and the remaining 51 were from 23 different cities and towns outside of Holyoke, and 5 outside the State. In other words, in the year ended September 30, 1916, only 65 per cent. of the infant mortality rate belonged to Holyoke, the other 35 per cent. being caused by deaths of babies born in other cities and towns, whose infant mortality rate was of course diminished with each baby sent to Holyoke.¹ Holyoke's true infant mortality rate was only 110 per 1,000 births instead of 182, as shown in Table 51. A careful analysis of the returns of other cities and towns in which children's hospitals are located would probably show lower infant mortality rates than appear in Table 51.

The highest proportion of deaths occur in the early period of infancy, and especially is this true of the first few days. In 1916, 2,711 deaths occurred in the first week, constituting 29 per cent. of all deaths under 1 year of age. On the first day the percentage of deaths (14) was higher than on any other day. In the first month of life there were 3,939 deaths, or 42.2 per cent. of all infant deaths. In the first three months there were 5,424 deaths, or 58.1 per cent. of all infant deaths. Three-fourths (75.2 per cent.) of the infant deaths occurred in the first half of the year.

This concentration of deaths in the early part of the first year of life is common to infant mortality elsewhere. For the registration area of the United States in 1915 the excess of deaths during the first weeks is even more marked. In this area deaths under 1 day formed 16.1 per cent. of all infant deaths, as compared with 14 per cent. in Massachusetts, while deaths under 1 week were 31.9 per cent., under 1 month 46.7 per cent., and under 3 months 63

¹ From a paper on Infant Mortality and its Relation to National Defense, delivered by Dr. Fred H. Allen before a meeting of the Parent Teachers Association at Holyoke, October 4, 1917.

per cent., as compared with 29, 42.2, and 58.1 per cent., respectively, in Massachusetts.

Babies are weakest at birth and during early infancy, and the hazard of life is greatest during the first weeks and months after birth. A large number of the deaths in early infancy are due to the fact that many babies are born with some handicap, and that in many instances the mother has been subjected to some condition which resulted in the birth of a child incapable of withstanding the ordinary strain of life. Proper prenatal care of mothers is of the utmost importance as a means of reducing the number of early deaths. Efforts toward this end have been made in several municipalities, notably in Boston, by hospitals, visiting nurses, health officers and others, who have attempted to make adequate medical advice and obstetrical care available to all mothers during pregnancy.

Over four-fifths (84.8 per cent.) of the 2,711 babies who died less than one week after birth died of prematurity, congenital debility, or malformations, or injuries received at birth. Of the 3,416 babies who died from these causes before reaching the age of 1 year, 35.3 per cent. died in less than one day, 67.4 per cent. died in less than one week, and 79.4 per cent. died in less than one month. The second most important cause of infant deaths, gastric and intestinal diseases, claimed 2,215, or 23.7 per cent., of the babies who died before reaching 1 year of age. Twelve per cent. of the babies who died from this cause died in less than one month after birth, 11 per cent. within one but less than two months after birth, 11.8 per cent. within two but less than three months after birth. Tables 57, 57*a*, and 58, on pages 144 to 149, show the number of deaths by important causes of infant deaths for certain subdivisions of the first year of life in 1916 in the State and in cities having 50,000 inhabitants or more in 1915.

Diarrhea and enteritis* is the most important preventable cause of infant mortality, especially prevalent during the summer season, and due in large part to methods of feeding, hot weather, and the living and social conditions of the parents. With hygienic care, including cool baths, much fresh air, and careful feeding, many infants are able to pass through extremely hot weather without serious diarrheal disturbances. The mortality of infants from diarrhea and enteritis* has decreased steadily from 38.2 per 1,000 live births

in 1910 to 22.4 in 1916. Deaths under 2 years¹ of age from diarrhea and enteritis* for each month of the seven years 1910 to 1916 are shown in Table 56, on page 143, which illustrates in striking manner the great reductions that have been made in the number of deaths from this cause, probably due to infant welfare work carried on in many cities, particularly during the hotter months.

The largest number of deaths of infants is due to developmental and wasting diseases,* and the figures indicate a reduction in infant mortality due to these causes, — from 42.5 deaths per 1,000 live births in 1910 to 33.1 in 1916. Respiratory diseases also caused a considerable number of deaths. The number of deaths from bronchopneumonia* shows an increase in recent years, with a slight check in 1915 and 1916. In 1910 there were 695 infant deaths from this cause; in 1911, 732; in 1912, 859; in 1913, 1,082; in 1914, 1,455; in 1915, 1,068; in 1916, 1,006. The principal causes of infant deaths for the years 1910 to 1914 are shown in Table 55, on page 143.

At least 704 of the 9,334 infant deaths were due to preventable causes. Pneumonia, commonly due to bad ventilation, improper clothing or exercise, or a sequel of measles, whooping cough, or the grip, caused 403 deaths; tuberculosis, another preventable malady, killed 199 infants; diphtheria, easily curable if treated in time, killed 33 more. Heart diseases, due almost invariably at this period of life to infectious disorders, resulted fatally in 63 cases, while 6 children were burned to death. For the prevention of such deaths no one has quite the same opportunity or responsibility as the parent.

C. Cause of Death.

Sources of Error in Mortality Statistics. — The chief element of error in mortality statistics lies in the inaccuracy of the statement of the cause of death as reported by the attending physician, who may not have been in a position to feel reasonably certain as to the nature of the terminal illness, or who may, at the request of the family of the decedent, deliberately withhold a statement of the true cause of death, as when the condition is either tuberculosis, cancer, or syphilis. Statements of cause of death are often incomplete as a result of the unintentional failure of the physician to state all the

¹ Deaths from diarrhea and enteritis by months were not tabulated for children under 1 year of age.

morbid conditions known to him which resulted in the death.¹ It is also probable that there are many unavoidable errors of mistaken diagnosis.²

It should also be borne in mind that the process of classifying the thousands of different terms — some of them of a very indefinite or unsatisfactory character — under the 189 titles of the International List of Causes of Death presents many difficulties which are seldom fully appreciated by those who have not engaged in the work of classification. Even if each certificate of death out of the 56,366 received during 1916 at the office of the Secretary of the Commonwealth bore only a single cause, the process would present many difficulties. Many certificates, however, bear statements of two or more causes instead of one, and a system of selection, according to the precedents and rules of the International Committee, has been adopted by the United States Bureau of the Census,³ and is used in the office of the Secretary of the Commonwealth. Because of the complications attendant upon any attempt to show all primary and secondary terms in relation, it becomes necessary to base all statistical compilations of causes of death on the selection of a preferred term. As a result it is evident that there may be a margin of error, because in a considerable number of certificates only one of the contributory causes may be shown. Each definite cause of death as compiled, therefore, represents a minimum number, which would be increased if deaths from such causes that were not properly reported and hence were classified under various ill-defined titles could be included.

An extract of a report on "The Accuracy of Certified Causes of Death: Its Relation to Mortality Statistics and the International List," made by a Committee of the Section on Vital Statistics of

¹ For example, the statement of "acute nephritis" is often returned as a cause of death, with no mention of the "scarlet fever" which terminated in the "acute nephritis." "Meningitis" is sometimes reported as a cause, when there has been a primary condition, such as "whooping cough" or some form of traumatism, antecedent to the final condition.

² Dr. Richard C. Cabot, in an article on Diagnostic Pitfalls identified during a Study of 3,000 Autopsies, published in the Journal of the American Medical Association, December 28, 1912, page 2295, and Dr. Horst Oertel, in an article on The Inaccuracy of American Mortality Statistics, published in the American Underwriter, May, 1913, have pointed out that in the best hospitals bedside diagnoses of even the commoner maladies often prove to be erroneous on autopsy. In Dr. Cabot's study of 3,000 autopsies it was found that while the results were confirmatory of the original diagnoses to a high degree in certain classes of causes such as diabetes mellitus (95 per cent.), typhoid fever (92 per cent.), aortic regurgitation (84 per cent.), in others the percentages of correct diagnoses were very low: acute nephritis (16 per cent.), chronic myocarditis (22 per cent.), broncho-pneumonia (33 per cent.), acute endocarditis (39 per cent.), chronic interstitial nephritis (50 per cent.), miliary tuberculosis (52 per cent.), and active phthisis (59 per cent.).

³ Index of Joint Causes of Death, 1914.

the American Public Health Association in October, 1917, is printed on pages 263 to 267, of this report.¹

Principal Causes of Death. — Twenty-nine per cent. of the 56,366 deaths reported for 1916 were due to three causes, — heart diseases,* tuberculosis, and pneumonia; and nearly two-thirds (63.9 per cent.) were charged to nine causes, — the three just named, together with Bright's disease* and nephritis, cancer, cerebral hemorrhage,* diarrhea and enteritis, congenital debility* and malformations,* and violence.

The increase in the death rate in 1916 as compared with 1915 was due chiefly to increases in the number of deaths from: (1) acute anterior poliomyelitis (infantile paralysis),* from 32 in 1915 to 452 in 1916, an increase of 1,312.5 per cent; (2) organic diseases of the heart,* from 4,625 in 1915 to 7,152 in 1916, an increase of 54.6 per cent., corresponding to an increase in the death rate per 100,000 population from 125.2 to 189.4, or 51.3 per cent; (3) measles,* from 149 deaths in 1915 to 392 in 1916, an increase of 163.1 per cent., corresponding to an increase in the death rate from 4 to 10.4, or 160 per cent.; (4) influenza,* from 232 deaths in 1915 to 539 in 1916, an increase of 132.3 per cent., corresponding to an increase in the death rate from 6.3 to 14.3, or 127 per cent.; (5) tuberculosis of the lungs,* from 4,283 deaths in 1915 to 4,575 in 1916, an increase of 6.8 per cent., corresponding to an increase in the death rate from 116 to 121.2, or 4.5 per cent. Other diseases showing an increase in the death rates were: whooping cough,* from 7.7 per 100,000 population in 1915 to 9.2 in 1916; deaths from violence, from 72.9 in 1915 to 78 in 1916; pneumonia, from 101.2 in 1915 to 106.3 in 1916; acute bronchitis, from 8.5 in 1915 to 11.1 in 1916. Diseases showing a decrease in death rates were: congenital debility,* from 96 per 100,000 population in 1915 to 83.5 in 1916; diarrhea and enteritis (under 2 years),* from 68.7 in 1915 to 63.3 in 1916; typhoid fever, from 6.7 in 1915 to 4.6 in 1916.

The deaths from *heart diseases** (organic diseases of the heart* and endocarditis*) in 1916 numbered 8,174, or 14.5 per cent. of all deaths, or 216.4 per 100,000 population. Organic diseases of the heart* caused more deaths than any one disease, and in 1916 deaths from this cause increased 54.6 per cent. over 1915, while the death rate per 100,000 population increased to 189.4 for 1916, or 51.3

¹ In this report an asterisk (*) has been used in the text and tables to denote those certified causes of death which the committee, after careful consideration, reported were acceptable statements of causes of death without autopsy.

per cent. over the rate of 125.2 in 1915 and 43.1 per cent. over the average rate (132.4) for the five years from 1910 to 1914.

Tuberculosis in its various forms claimed 5,422 victims in 1916, of whom 4,575 died from tuberculosis of the lungs.* Deaths due to the latter cause constituted 8.1 per cent. of all deaths during the year, as compared with 8.1 per cent. for the five years 1911 to 1915. In the six years from 1910 to 1915 the death rate from tuberculosis of the lungs* fell from 133.2 to 116 per 100,000 population, a drop of 12.9 per cent., the decline being continuous from year to year. In 1916, however, there was an increase in the death rate from this disease to 121.2. Tuberculosis of the lungs* has the unenviable distinction of causing more deaths than any other form of bodily illness except heart diseases.*

Pneumonia (including bronchopneumonia*) was responsible for 6,567 deaths in 1916, or 173.9 per 100,000 population, as compared with 174.6 in 1915, 164.3 in 1914, and 170.8 in 1913. The fluctuation in the death rates from year to year has been pronounced.

*Bright's disease** and *nephritis* were the causes of 3,490 deaths in 1916, corresponding to a rate of 92.4 per 100,000 population, as compared with an average rate of 93.3 for the five years from 1910 to 1914. There were 3,222 deaths caused by Bright's disease* and 268 by acute nephritis.

Next in order of deadliness come *cancer and other malignant tumors*, which caused 3,990 deaths in 1916. Of these, 1,576, or 39.5 per cent., resulted from cancers of the stomach and liver. The death rate from cancer has risen from 89.6 in 1910 to 105.7 in 1916. The increase has been continuous. It is possible that at least a part of this increase is due to more correct diagnosis and greater care on the part of physicians in making reports.

Congenital debility and malformations** caused 3,151 deaths in 1916, corresponding to a rate of 83.5 per 100,000 population. The death rates from these causes have shown a steady decline from 109.2 in 1910 (with the exception of 1912, 114.2).

*Apoplexy** was the cause of 3,510 deaths, or 93 per 100,000 population. The death rate from this disease has fluctuated somewhat, from 98.2 in 1910 to 98.1 in 1911, 101.1 in 1912, 97.8 in 1913, 72.9 in 1914, 94.3 in 1915.

Diarrhea and enteritis caused 2,863 deaths in 1916, or 75.8 per 100,000 population. This rate has shown a marked falling off in

recent years. Nearly 84 per cent. of the total number of deaths charged to these causes in 1916 were of infants under 2 years of age.* The rates for this cause have declined steadily from 110.8 in 1910 to 95 in 1911, to 90.5 in 1912, to 82.7 in 1913, to 78 in 1914, to 68.6 in 1915, to 63.3 in 1916, — a drop of 42.9 per cent. in seven years. This decline is due largely to the successful campaigns waged against infant mortality.

The fatal cases of *diphtheria and croup** — which are classed together in the statistics, but practically all of which are of diphtheria — numbered 629, or 16.7 per 100,000 population in 1916, as compared with 19.5 in 1915, 17.9 in 1914, 17.6 in 1913, 13.5 in 1912, 16.4 in 1911, and 20.1 in 1910.

The mortality from *typhoid fever** has shown a remarkable decline since 1910, having dropped from 12.2 in that year to 4.6 in 1916, the decrease amounting to 62.3 per cent. in the seven-year period. This decline is greater, relatively, than that shown for any other important cause of death. The total number of deaths due to typhoid fever* in 1916 was 172, as compared with 246 in 1915, 268 in 1914, 280 in 1913, 269 in 1912, 302 in 1911, and 411 in 1910. This showing is a striking example of the efficacy of preventive measures and improved methods of sanitation.

The principal epidemic maladies of childhood — *whooping cough**, *measles**, and *scarlet fever** — were together responsible for 865 deaths of both adults and children, or 23 per 100,000 population in 1916, the rates for the three diseases separately being 9.2, 3.4, and 10.4, respectively. The mortality rates for all three of these diseases fluctuated greatly from year to year.

Deaths from *violence* have fluctuated considerably, although the general tendency has been upward, the rates per 100,000 population being 83.6 in 1910, 99.2 in 1911, 88.2 in 1912, 90.1 in 1913, 84.3 in 1914, 86.8 in 1915, and 90.1 in 1916.

Deaths due to *railroad accidents and injuries** totaled 284 in 1916, or 7.5 per 100,000 population. This number included fatalities resulting from collisions between railroad trains and vehicles at grade crossings. The rates for previous years were 7.1 in 1915, 6.9 in 1914, 9.5 in 1913, and 10.1 in 1912. No separate data as to deaths from railroad accidents and injuries* for the years prior to 1912 are available.

Deaths resulting from *street car accidents and injuries** numbered

77, or 2 per 100,000 population. No separate data as to deaths from street car accidents and injuries* for the years prior to 1912 are available.

*Automobile accidents and injuries** caused 314 deaths in 1916, or 8.3 per 100,000 population. There has been an increase in this rate from year to year, — 3.8 in 1912, 4.6 in 1913, 5.3 in 1914, and 7.2 in 1915. No accurate data are available for measuring the death rate per number of automobiles in use, as the statistics compiled by the Highway Commission show the number of machines registered, and thus contain duplications, since one machine may be registered more than once in a calendar year. It is probable, however, that the increase has not been so rapid as that of the number of machines in use. No separate data as to deaths from automobile accidents and injuries* for the years prior to 1912 are available.

Deaths caused by *machinery accidents** in 1916 numbered 80, or 2.1 per 100,000 population. The corresponding figures for previous years were 2.3 in 1912, 2.3 in 1913, 1.9 in 1914, and 1.9 in 1915. No separate data as to deaths from machinery accidents* for the years prior to 1912 are available.

The number of *suicides** reported for 1916 was 455, or 12.1 per 100,000 population. The rates since 1910 (13) have been, 1911, 13; 1912, 13.6; 1913, 13.6; 1914, 13.6; and 1915, 13.9.

Deaths caused by *firearms* numbered 197 in 1916, corresponding to a rate of 5.2 per 100,000 population. Of these deaths, 121 were suicides,* 52 were homicides, and 24 were accidental (including those concerning which the status as to suicide, homicide, or accident was in doubt).

Deaths from *homicide** numbered 115 in 1916, or 3 per 100,000 population. The rate for homicides shows an almost steady increase in recent years, — from 2.2 in 1910 to 2.5 in 1911, 2.6 in 1912, 3.1 in 1913, 2.9 in 1914, 3.1 in 1915, and a drop to 3 in 1916.

The causes of death of males and females for each month and at seventeen age periods for the Commonwealth for the full International List of Causes of Death with certain subdivisions are shown in Table 61, on pages 164 to 193. In Table 62, on pages 194 to 218, the deaths are shown for 48 causes and groups of causes for each municipality. For the Commonwealth as a whole the deaths and death rates for the six years 1911 to 1916 are shown for the 38 causes and groups of causes in the Abridged International

List in Table 64, on pages 220 and 221. The relation of this list to the Detailed International List is shown in Appendix B, on pages 269 to 273. In addition to the above presentations, certain other tables showing the causes of deaths are presented on pages 219 to 224.

D. Maternal Mortality.

In 1916 there were 525 women between the ages of 15 and 45 who died from conditions caused by childbirth;* 159 of these died from childbed fever,* a disease proved to be almost entirely preventable; and the remaining 366 died from diseases* now known to be to a great extent preventable or curable by modern scientific care. These diseases caused by pregnancy and confinement were responsible for more deaths among women 15 to 49 years of age than any disease except tuberculosis, cancer, and heart diseases.* While the death rates for many important preventable diseases have fallen in recent years, no substantial decrease can be found in the death rates for childbirth. On the contrary, not only has the death rate from diseases caused by pregnancy and childbirth been increasing (from 9.6 in 1901 to 13.9 in 1916), but the proportion of deaths from these causes to the total number of deaths has increased (from .6 per cent. in 1901 to .9 per cent. in 1916).

The importance of the problem of maternal mortality has been admirably stated by Dr. Grace L. Meigs, of the United States Children's Bureau:¹

Each death at childbirth is a serious loss to the country. The women who die from this cause are lost at the time of their greatest usefulness to the State and to their families; and they give their lives in carrying out a function which must be regarded as the most important in the world.

A more accurate death rate from these diseases is that based on the group which alone is affected by these diseases, — women of child-bearing age. In 1915 the rate per 100,000 women 15 to 44 years of age from all diseases of pregnancy and confinement was 97.4, as compared with 74.8 in 1901; from puerperal infection the death rate was 22.3 in 1915, as compared with 15.6 in 1901.

In 1916 there were, among women 15 to 49 years of age, 1,592 deaths from tuberculosis (all forms); 603 deaths from cancer and other malignant tumors; 656 deaths from organic diseases of the

¹ Maternal Mortality from All Conditions connected with Childbirth, United States Children's Bureau, Publication No. 19, 1916, page 9.

heart;* 525 deaths from the diseases of pregnancy and confinement;* 440 from acute nephritis and Bright's disease;* 413 from pneumonia; 191 from cerebral hemorrhage;* 180 from violent deaths (suicide excepted); 148 from noncancerous tumors and other diseases of the female genital organs. Other diseases show far fewer deaths.

The death rate per 10,000 births (living and dead) gives a far clearer picture of the actual risk of childbirth than do any of the aforementioned rates. The death rate, calculated on this basis, for all diseases caused by pregnancy and confinement, increased from 37 in 1901 to 54 in 1916. The death rate per 10,000 live births increased from 38 in 1901 to 56 in 1916. In other words, for every 184 babies born one mother lost her life, and for every 178 babies born alive one mother lost her life. The corresponding proportions for 1910 were 223 and 215. The death rate for Massachusetts was much more favorable than that for the United States (provisional birth registration area, 1910). For the birth registration area of the United States in 1915 the death rate per 1,000 live births was 6, and for 166 babies born alive one mother lost her life.

The most accurate method of all for calculating the death rates from diseases caused by pregnancy and confinement is the number of deaths per 10,000 confinements, including stillbirths and making the proper deductions for plural births, or, in other words, the number of deaths per 10,000 women at risk. The death rates calculated on this basis show, with slight fluctuations, a general increase from 37 in 1901 to 55 in 1916. The increase in the annual average death rates, calculated on three-year and five-year average, is shown in the following tabular statement:—

YEARS.	Annual average death rate from diseases of pregnancy and confinement per 10,000 confinements calculated on a three-year average.	YEARS.	Annual average death rate from diseases of pregnancy and confinement per 10,000 confinements calculated on a five-year average.

E. Deaths investigated by Medical Examiners.

Source of Data. — The statistics of deaths investigated by medical examiners are based upon original data obtained by the registration of deaths following injury or violence. The registration of such deaths is accomplished by the use of a blank or schedule known as a death certificate, which corresponds to the standard certificate of death.

Medical examiners are often called upon to view cases in which the death was not due to violence, such as heart disease, apoplexy, etc., but where the death was simply sudden or where no physician had been in recent attendance. Such action is not required by the law, and may be caused by the fact that the person who notified the examiner did not understand the duties of medical examiners, or in order that a certificate for burial might be obtained.

Discrepancies often occur in the statistics of causes of death based upon the returns to the registrars and those based upon the returns of the medical examiners, especially as to deaths from homicide and suicide. It is fair to assume that the returns of the medical examiners are the more accurate, because the question of homicide, suicide, or accident is often not determined until after the certificate for burial purposes has been furnished to the registrar.

Number of Deaths. — The number of deaths investigated by the medical examiners in 1916 was 7,028, or 12.5 per cent. of the total number of deaths which occurred during the year, as compared with 6,516 deaths in 1915, or 12 per cent. of the total number of deaths.¹ About two-thirds (67.3 per cent.) of these deaths were of males. Of the deaths investigated by medical examiners, 3,085, or 44.0 per cent., were reported as due to violence, while among the deaths returned to the registrars 3,402 were reported as due to violence.

The largest number of cases investigated by medical examiners in 1916 was in Suffolk County, 2,280, as compared with 1,960 in 1915. Of the deaths investigated in Suffolk County, 999, or 43.8 per cent., were reported as due to violence. (See Table 70, pages 226 and 227.)

Autopsies. — Autopsies were made in 791, or 11.3 per cent., of the cases investigated by the medical examiners in 1916, as com-

¹ There were 3,300 stillbirths registered in 1916 and 3,161 in 1915. The number of stillbirths viewed by medical examiners was 104 in 1916 and 122 in 1915.

pared with 9.7 per cent. in 1915, 7.6 per cent. in 1914, 13.9 per cent. in 1913, and 11.9 per cent. in 1912.

The highest proportion of autopsies was in Suffolk County, where 21.2 per cent. of the views were autopsied, as compared with 18.1 per cent. in 1915. Table 72, on pages 236 and 237, shows the number of views and the number of autopsies in each county in each year from 1907 to 1916, and the number and per cent. of views autopsied for the ten-year period 1907 to 1916.

Cause of Death. — Nearly one-half (49 per cent.) of the deaths viewed by the medical examiners in 1916 were due to natural causes. Fifty-three per cent. of the deaths were from causes not due to violence, 44 per cent. were due to violence, and 3 per cent. were from unknown or ill-defined causes.

Deaths from causes not due to violence numbered 3,736, of which 3,434 were from natural causes and 302 were due to alcoholism.

Deaths due to violence numbered 3,085, of which 2,467 were due to accident or negligence, 468 were suicides, and 150 were homicides.

Of the 2,467 deaths due to accident or negligence, 447 were due to falls and blows, 318 resulted from drowning, 299 were due to railroad accidents, and 298 were due to automobile accidents.

The increase in the number of deaths due to automobile accidents in 1916 over previous years is shown in the following table: —

YEARS.	Deaths from automobile accidents.	YEARS.	Deaths from automobile accidents.
1909,	39	1913,	152
1910,	66	1914,	166
1911,	97	1915,	260
1912,	129	1916,	298

Suicides numbered 468, or 15.2 per cent. of the deaths due to violence. Suicides committed with firearms (129) and by the use of illuminating and other gases (110) constituted over one-half (51.1 per cent.) of the total number. Other methods were: by poisons (55), by hanging or strangulation (68), and by drowning (49). Nearly three-fourths (73.9 per cent.) of the suicides were males.

One hundred of the 468 persons committing suicide were 30 to 39 years of age, 93 were 50 to 59 years of age, 87 were between 40 and 50 years of age, 67 were 20 to 29 years of age, 101 were over

60 years of age, 14 were under 20 years of age, and 6 were of unknown ages. Among the male suicides the largest numbers were from 30 to 39 years of age (76) and from 50 to 59 years (73), while among the female suicides the largest numbers were from 40 to 49 years of age (31) and from 30 to 39 years (24). Among the males the most common method of committing suicide was by the use of firearms (115, or 33.2 per cent.), while among the females the most common method was by illuminating or other gases (39, or 32 per cent.).

Homicides numbered 150, of which 46 were by firearms, 23 were by falls or blows, 30 were cases of abortion, 14 were cases of infanticide. Of the 150 homicides, 77, or 51.3 per cent., were of males.

¹ Cities are printed in small capitals.² Exclusive of stillbirths.

³ The rates shown in this column are "crude rates," based on the total population, and make no allowance for differences in the sex and age distribution of the population. The rates for certain localities are materially affected by deaths of nonresidents who may be attracted to those localities by their superior hospital facilities, or who may resort to certain localities for treatment of tuberculosis, mental defects, or other diseases. In those localities in which deaths of nonresidents occurred, the death rates excluding nonresidents is shown; but it should be borne in mind that even these rates are not accurate, as it has not been possible to deduct from the population of those localities the number of nonresidents included in the total population. Inferences in regard to the relative healthfulness of different localities, therefore, should not be drawn without more thorough investigation.

⁴ Fifteen nonresidents.

¹ Exclusive of stillbirths.

² These are the causes of death or groups of causes which are most important at this age. The numbers of the Detailed International List are shown in full face type to facilitate their identification. In order to make the discussion of the figures easier, these causes of death have been classified in 8 groups.

³ The term "gastric and intestinal diseases," as used in this table, includes, as above shown, only the diseases of this type which are the most important among infants; i.e., diseases of the stomach, diarrhea, and enteritis. It does not include all "diseases of the digestive system" as classified under this heading in the Detailed International List.

¹ Exclusive of stillbirths.

² These are the causes of death or groups of causes which are most important at this age. The numbers of the Detailed International List are shown in full face type to facilitate their identification. In order to make the discussion of the figures easier, these causes of death have been classified in 8 groups.

³ The term "gastric and intestinal diseases," as used in this table, includes, as above shown, only the diseases of this type which are the most important among infants; *i e.*, diseases of the stomach, diarrhea, and enteritis. It does not include all "diseases of the digestive system" as classified under this heading in the Detailed International List.

POPULATION STATISTICS.

	PAGE
Introductory,	241
State census of 1915,	241
Estimates of population,	242
Statistical tables, ¹	244

Introductory.—Statistical information relative to the population of a State or community is essential to a proper understanding of its vital events, such as births, marriages, and deaths. These events are generally expressed in terms of the population, that is, as rates per 1,000 or 100,000 inhabitants or group of inhabitants. The number of inhabitants in most localities is constantly changing, and in order to ascertain the population an enumeration or census is made in this Commonwealth every five years. For the intercensal years it is necessary to estimate the number of living.

State Census of 1915.—The official report on the census of 1915² shows that the total population of Massachusetts on April 1, 1915, was 3,693,310. This is an increase of 9.7 per cent. over 1910, and of nearly 23 per cent. over 1905. The estimated population as of July 1, 1916, was 3,775,720.

The population of Boston was 745,439, an increase of 74,854 in five years, the acquisition of Hyde Park accounting for about 15,500. The Metropolitan District, or Greater Boston, gained 163,664,—from 1,423,429 in 1910 to 1,587,093 in 1915. The estimated population of the city of Boston for July 1, 1916, was 760,400. The census population of the cities and towns of this Commonwealth, by sex, for 1910 and 1915, is shown in Table 79, on pages 249 to 259, and the estimated population, as of July 1, 1916, for each city and town for both sexes combined, is shown in Table 1, on pages 17 to 23.

¹ For a list of the tables on population statistics, see page iii.

² Return of the Director of the Bureau of Statistics of the number of inhabitants and legal voters as determined by the decennial census of 1915. House Document No. 1169 (1916).

At the time this report was prepared, the census figures for the population by sex for the State, counties, cities, and towns were available.

Estimates of Population. — The arithmetical method of computing estimates of population for the intercensal years is used in the preparation of the annual reports on vital statistics of Massachusetts. This method assumes that the same amount of increase took place in each intercensal year, and has been generally adopted by bureaus of vital statistics in the United States as being at once the simplest and as having been shown by experience to result, in the majority of cases, in a closer approach to accuracy than any other available method.

A test of this method, based on the State (1905) and Federal (1910) censuses, showed that the estimated population for April 1, 1915, was 3,729,152, or 35,842, or .97 per cent., more than the actual enumeration (3,693,310). The method used by the United States Bureau of the Census, based on the Federal (1900 and 1910) censuses, showed a population of 3,648,137, a difference of 45,173, or 1.23 per cent., less than the actual enumeration.

The estimated population for July 1, 1916, computed on the basis of the State and Federal censuses of 1915 and 1910, is 3,775,720, as compared with 3,719,156 as estimated by the United States Bureau of the Census on the basis of the Federal censuses of 1900 and 1910.

The method of estimating the population for the intercensal years used in this report gives a birth rate of 24.8 and a death rate of 14.9 for 1916, while the method used by the United States Bureau of the Census gives a birth rate of 25.1 and a death rate of 15.2. Although these differences are very slight for 1916, the variations between the rates computed by the two methods will be wider each year until the next Federal census (1920).

The method of calculating estimates of population for the intercensal years is shown in the following example: —

Massachusetts had a population of 3,693,310 at the State census of 1915 (April 1), and of 3,366,416 at the Federal census of 1910 (April 15). The increase during the intercensal period (59½ months) was 326,894, and the monthly increase, according to the arithmetical method of estimating population, was —

$$\frac{3,693,310 - 3,366,416}{59.5} = 5,494.$$

The population July 1, 1914, is estimated by adding to the population as it existed April 15, 1910, 5,494 for each month intervening between the date of enumeration (April 15, 1910) and the date for which the estimate is to be made (July 1, 1914). There being 4 years and $2\frac{1}{2}$ months (or 50.5 months) between these dates, the calculation would be —

$$3,366,416 + (50.5 \times 5,494) = 3,643,863.$$

The same annual increase is also assumed to occur until the next census shall have been taken. The population for July 1, 1916, is estimated by adding to the population as it existed at the preceding census (April 1, 1915) 5,494 for each month intervening between the date of enumeration and the date for which the estimate is desired (July 1, 1916). There being 15 months between these dates, the calculation would be —

$$3,693,310 + (15 \times 5,494) = 3,775,720.$$

APPENDIX A.

THE ACCURACY OF CERTIFIED CAUSES OF DEATH.

ITS RELATION TO MORTALITY STATISTICS AND THE INTERNATIONAL LIST.¹

Revised report of a committee of the Vital Statistics Section of the American Public Health Association, composed as follows: Committee — Haven Emerson, chairman; William H. Guilfooy, E. H. Lewinski-Corwin, Louis I. Dublin, Charles Norris, Warfield T. Longcope, W. R. Williams, William H. Davis, George H. Van Buren, executive secretary.

This report is a summary of the conclusions of a committee appointed by the Section on Vital Statistics of the American Public Health Association to consider the question of the accuracy of certified causes of death and their relation to mortality statistics and the International List of Causes of Death.

At the meeting of the Section on Vital Statistics, held Sept. 10, 1915, at Rochester, N. Y., Dr. Haven Emerson, commissioner of health of New York City, read a paper, a synopsis of which follows:—

RELIABILITY OF STATEMENTS OF CAUSE OF DEATH FROM THE CLINICAL AND PATHOLOGICAL VIEWPOINTS.²

While completeness of records of death is desirable, it is of no more importance than the accuracy of the causes themselves as stated on the death certificates.

The primary necessity for reliable and adequate statement of cause of death is obvious. The high percentage of inaccuracy in certificates of death is well known to registrars, to life insurance companies, and to pathologists, who can compare clinical diagnoses with the demonstrated cause of death at the autopsy.

If the 189 titles of the International List are studied in the light of present-day knowledge of clinical and pathological experience, it will appear that there is no plausible guarantee of accuracy in at least 41 per cent. of the certificates as now presented to the registrar of records of the New York City health department.

In this 41 per cent. we find 2,875 deaths in 1914 attributed to causes that can be accepted as reliable only after autopsy and 27,995 which are capable of verification by exact observations, as by chemical, bacteriological, and biological tests before death, but, failing such specific proof, represent no reliable statement of death without autopsy.

It is proposed to separate the reliable or probably correct statements of cause of death from the remainder as another step forward in the evolution of accurate statistics of deaths.

¹ Reprint from the Public Health Reports, United States Public Health Service, Vol. 32, No. 39, Sept. 28, 1917, pp. 1557-1632.

² For the full text of this paper see the American Journal of Public Health, July, 1916.

After the discussion of Dr. Emerson's paper the chairman was authorized to appoint a committee to consider the reliability of the causes of death as specified in the International List of Causes of Death. The committee is as follows: —

Haven Emerson, <i>chairman</i> .	Charles Norris.
William H. Guilfoxy.	W. R. Williams.
E. H. Lewinski-Corwin.	William H. Davis.
Louis I. Dublin.	George H. Van Buren, <i>executive secretary</i> .
Warfield T. Longcope.	

Meetings, at which the chairman presided, were held in New York City in November and December, 1915; also in January, February, March, April, May, and June, 1916.

The committee submitted a report to the Section on Vital Statistics at the annual meeting of the American Public Health Association at Cincinnati in October, 1916. The section devoted parts of three of its sessions to the consideration of this report. At the final meeting of the section it became evident that there would not be sufficient time to consider all of the recommendations submitted. It was voted, therefore, to continue the committee for another year and to instruct it to submit its recommendations, as published in Reprint No. 363 of the Public Health Reports, to all members of the Section on Vital Statistics, and to others well qualified to criticize and suggest, with the request that they give the committee the benefit of their opinions. This was done. Letters were received from many of those throughout the country most interested in the subject of classification of causes of death. The committee desires at this point to express its thanks for the interest manifested in the subject by those who gave to it of their time and thought. Four meetings of the committee were required to consider the suggestions which were received.

The present report, therefore, is, in reality, a revised one. It represents not simply what may now be considered as the preliminary recommendations resulting from the committee's deliberations of last year, but also its conclusions in the light of criticisms and suggestions received during 1917 from those who are best qualified to make them.

.

The committee was appointed primarily with the idea that it would make recommendations covering the 189 titles of the Inter-

national List of Causes of Death with a view to separating them into two classes: —

(a) Those not to be accepted as reliable, without autopsy, or without specific supporting data upon which accurate diagnosis is possible.

(b) Those to be accepted as reliable without autopsy, other verification, or supporting data.

It was pointed out, however, that as the committee was one on the *accuracy* of certified causes of death it should also consider: —

(a) The validity of terms included under each title, *i.e.*, the probability that each term, when reported as a cause of death, represents the exact morbid condition covered by the title heading. It was agreed that this phase of the subject be considered secondary to that of determining the question of the reliability of the titles as described above. In the course of the committee's discussions, however, it frequently became necessary to discuss the question of reliability on the basis of each included term. This is particularly true of titles under which are included both diseases that are seldom fatal and those that are surely fatal or in which the prognosis is grave.

(b) The fact that a term's reliability as a statistical entity when reported as a cause of death depends not only upon the fact that the disease which it describes was surely present, but also upon its status as descriptive of the *primary* cause of death. As an instance of this there are a number of titles which the committee might assign to the reliable class, because diagnosis of the conditions covered by them are certain; nevertheless, statistics based on these very returns would be grossly inaccurate, because there would be inaccuracy in the statement of cause of death through the omission of the *primary* cause, even though the terminal condition, and the only one reported, were one that is reliable without autopsy. It was agreed that this is a phase that has an important bearing on what constitutes a reliable statement of cause of death and that the committee should give it consideration. It was decided, however, that it should, so far as possible, be discussed as a separate and distinct problem upon which the committee should make recommendations.

In considering the International List from the viewpoints outlined above, and in making its recommendations, the committee has been mindful of the fact that, as is plainly set forth in the "Introductory" of the manual issued by the Bureau of the Census, "The International List of Causes of Death makes no pretension of being a proper nomenclature of diseases, or of including a scientific classification of diseases. It is only a practical working list whereby statistical compilers can assign medical terms reported by physicians as causes of death to certain more or less definite titles representing individual diseases or groups of diseases of similar character." The committee

realizes that such a list necessarily contains many terms that are unscientific, inaccurate, and indefinite, as well as some that are obsolete. It has borne in mind, however, that many of these expressions are now, and will continue to be, encountered in the practical experience of registration offices, and that since it is not always practicable or possible to obtain more satisfactory statements, it is necessary for registration and compiling offices to use a list like the International List of Causes of Death in order that such expressions, together with the definite and scientific terms, may be compiled uniformly and under the titles which are most likely to cover the conditions reported. When it recommends, therefore, that titles or terms in the list be "eliminated" it means that they should not be mentioned in any official publication of statistical or registration offices in such a way as to convey to physicians in general the impression that their use is sanctioned by these offices. Whenever it is necessary to include such terms they should be printed with some identifying sign to show that they are not approved as statements of cause of death, as was done in the 1902 Manual of the International Classification (list) of Causes of Death, issued by the Census Bureau.

The committee does not propose that mortality statistics along the lines it recommends be substituted for those now published annually. However, it does believe that additional information should be asked for upon the death certificate as to whether or not an autopsy was performed or as to what test confirmed the diagnosis. Moreover, it believes that as a purely supplemental study this additional information when sufficiently complete should be tabulated to show the number of deaths compiled on the basis of specific supporting data.

The committee, however, wishes to emphasize the fact that to secure accuracy of all certified causes of death is absolutely beyond the power of any statistical bureau at the present time.

Two educational movements are needed before this can be accomplished:—

(1) The physicians must be educated to ask for post mortems when needed to determine the cause of death, and to base their diagnoses, where possible, upon specific laboratory evidence of the cause of disease.

(2) The public must be educated to permit post mortems when requested to determine the cause of death.

Only by such means can a satisfactory percentage of accuracy in mortality statistics be obtained.

Moreover, this day of accuracy of certified causes of death should arrive much sooner for a city, with its hospitals, than for a State, and much sooner for some States than for others.

The committee therefore recommends that the Vital Statistics Section indorse the educational propaganda which so clearly shows the unreliability of so many death returns as now reported; that it indorse educational propaganda which shows both physicians and the public the importance of post-mortem examinations and of laboratory aids in diagnosis; that it indorse the proposed changes in the International List of Causes of Death, together with the reliable inclusions under each title, and that it advocate the publication of tables, as a purely supplemental study, showing the number of deaths compiled on the basis of specific supporting data whenever these data shall become sufficiently well reported.

Then follow (pages 9 to 77) the conclusions relating to each title of the International List. These conclusions, or as many of them as are approved by the section, will be submitted to the International Commission charged with the revision of the International List, which is scheduled to meet in 1919.

APPENDIX B.

INTERNATIONAL CLASSIFICATION OF CAUSES OF DEATH.¹

There are two separate and distinct classifications of causes of death embodied in the International List of Causes of Death: these are the detailed and abridged International Lists. The former, as indicated by its name, presents causes of death in greater detail than does the latter; that is, it shows separately certain diseases which in the abridged list are grouped together for presentation. The majority of the titles of the abridged list are therefore consolidations of certain titles of the detailed list. The shorter list is used as a basis for certain tables in this volume for which it is either unnecessary or impracticable to present data for each disease and cause of death shown in the detailed list.

The distinction between these lists should always be considered when using the tables of these reports. There are several cases in which the title headings in the two lists are identical, but the causes included are widely at variance. As an example of this the title "Other epidemic diseases" of the detailed list (title No. 19) includes only such epidemic maladies as are not classified separately in titles 1 to 18 of that list; but "Other epidemic diseases" of the abridged list includes titles 3, 11, 14, 15, 16, 17, 18, and 19 of the detailed list. These identical expressions, it will be noted, have two different and distinct meanings. In the abridged list "Tuberculosis of the lungs" (title No. 13) includes not only tuberculosis of the lungs of the detailed list (title No. 28) but also acute miliary tuberculosis (title No. 29).

An asterisk (*) denotes that, in the opinion of the committee appointed by the Section on Vital Statistics of the American Public Health Association, the titles are acceptable statements of causes of death without autopsy.²

¹ This second decennial revision of the International Classification of Causes of Death made at Paris July 1-3, 1909, was designed for use during the present decade. The next revision will be made in 1919 for use in the twenties. The causes of death as given in the second revision number 189, compared with 179 in the first classification.

² See Appendix A.

The following table shows each title of the Detailed International List:—

1. DETAILED INTERNATIONAL LIST.

I. GENERAL DISEASES.

1. Typhoid fever.*
2. Typhus fever.*
3. Relapsing fever.¹
4. Malaria.²
5. Smallpox.*
6. Measles.*
7. Scarlet fever.*
8. Whooping cough.*

21. Glanders.⁵

I. GENERAL DISEASES — *Con.*

22. Anthrax.⁶
23. Rabies.⁷
24. Tetanus.⁸
25. Mycoses.⁹
26. Pellagra.*
27. Beriberi.*
28. Tuberculosis of the lungs.*
29. Acute miliary tuberculosis.¹⁰
30. Tuberculous meningitis.¹¹
31. Abdominal tuberculosis.¹²
32. Pott's disease.*
33. White swellings.*
34. Tuberculosis of other organs.¹³
35. Disseminated tuberculosis.*
36. Rickets.*
37. Syphilis.¹⁴
38. Gonococcus infection.¹⁵
39. Cancer of the buccal cavity.*
40. Cancer of the stomach, liver.¹⁶
41. Cancer of the peritoneum, intestines, rectum.¹⁶

¹ This statement is a reliable one, without autopsy, only when the statement of the cause of death is accompanied or supported by a record of the finding of the etiological factor; that is, the *spirillum* (*spirochaeta*) *obermeieri*, before death.

² Not a reliable statement of cause of death without the supporting statement that the etiological factor, the *plasmidium malariae*, was found in the blood before death or at autopsy.

³ Not a reliable statement of cause of death unless the specific cause of infection has been identified.

⁴ A reliable statement of cause of death if there is an accompanying statement of the site and nature of the original infection.

⁵ Not a reliable statement of cause of death, without autopsy, unless there is an accompanying record of the finding of the etiological factor; *i.e.*, the *bacillus mallei*.

⁶ Not a reliable statement of cause of death, without autopsy, or without determination of the etiological factor; *i.e.*, the *bacillus anthracis*.

⁷ Not a reliable statement of cause of death unless verified by autopsy, or proof that the infecting bite was by a proved rabid animal.

⁸ A reliable statement of cause of death, without autopsy, when it is accompanied by information as to date, site, nature, and means of injury.

⁹ A reliable statement of cause of death, without autopsy, *only* when lesion is accessible to direct examination, or the etiological factor has been identified in the discharges before death.

¹⁰ Not a reliable statement of cause of death, without autopsy, unless tubercles have been found in some accessible part of the body (*e.g.*, the retina) during life.

¹¹ A reliable statement of cause of death, without autopsy, for children under 10 years of age, but not for decedents of older groups, unless there is confirmatory bacteriological proof of the presence of the tubercle bacillus in the spinal fluid.

¹² An unreliable statement of cause of death, without autopsy, unless proof of an abdominal operation or recovery of tubercle bacillus from the abdominal fluid is presented.

¹³ Statements of cause of death which relate to organs or parts of the body which are accessible to direct vision are reliable without autopsy.

¹⁴ Not reliable as a statement of cause of death, without autopsy, unless diagnosis was based on lesions superficially situated or visible through body orifices, or confirmed by unquestioned specific test. A statement of the site, extent, and character of the lesion should be given.

¹⁵ An unreliable statement of cause of death, without autopsy, unless a gonococcic lesion has been demonstrated by the recovery of the gonococcus from the site of the lesion, or by a specific serum reaction, and unless the lesion was an adequate cause of death.

¹⁶ An unreliable statement of cause of death, without autopsy, unless an operation was performed or the neoplasm was otherwise visible or accessible for direct observation.

1. DETAILED INTERNATIONAL LIST — *Continued.*I. GENERAL DISEASES — *Con.*

42. Cancer of the female genital organs.¹

58. Other chronic occupation poisonings.⁵
59. Other chronic poisonings.⁶

II. DISEASES OF THE NERVOUS SYSTEM AND OF THE ORGANS OF SPECIAL SENSE.

60. Encephalitis.
61. Meningitis.
 - (a) Simple meningitis.
 - (b) Cerebrospinal meningitis (undefined).
 - (c) Cerebrospinal fever.
62. Locomotor ataxia.*
63. Other diseases of the spinal cord.
 - (a) Acute anterior poliomyelitis.*
 - (b) Other diseases of the spinal cord.
64. Cerebral hemorrhage, apoplexy.*
65. Softening of the brain.
66. Paralysis without specified cause.
67. General paralysis of the insane.*
68. Other forms of mental alienation.

II. DISEASES OF THE NERVOUS SYSTEM AND OF THE ORGANS OF SPECIAL SENSE — *Con.*

69. Epilepsy.⁷
70. Convulsions (nonpuerperal).
71. Convulsions of infants.
72. Chorea.*
73. Neuralgia and neuritis.
74. Other diseases of the nervous system.
75. Diseases of the eyes and their annexa.*
76. Diseases of the ears.*

III. DISEASES OF THE CIRCULATORY SYSTEM.

77. Pericarditis.⁸
78. Acute endocarditis.*
79. Organic diseases of the heart.*
80. Angina pectoris.*
81. Diseases of the arteries, atheroma, aneurism, etc.
82. Embolism and thrombosis.*
83. Diseases of the veins (varices, hemorrhoids, phlebitis, etc.).⁹
84. Diseases of the lymphatic system (lymphangitis, etc.).*
85. Hemorrhage; other diseases of the circulatory system.*

IV. DISEASES OF THE RESPIRATORY SYSTEM.

86. Diseases of the nasal fossæ.*
87. Diseases of the larynx.*
88. Diseases of the thyroid body.*
89. Acute bronchitis.
90. Chronic bronchitis.*
91. Broncho-pneumonia.*
92. Pneumonia.
 - (a) Lobar pneumonia.
 - (b) Pneumonia (undefined).
93. Pleurisy.*

¹ An unreliable statement of cause of death, without autopsy, unless an operation was performed or the neoplasm was otherwise visible or accessible for direct observation.

² An unreliable statement of cause of death, without autopsy, unless an operation was performed.

³ Not a reliable statement of cause of death unless verified by confirmatory blood examination.

⁴ A reliable statement of cause of death, without autopsy, *if* there appears a statement of an occupation in which decedent would be subject to lead poisoning, or if the source of the poisoning is specified and complications accompanying, sufficient to cause death, are described.

⁵ A reliable statement of cause of death, without autopsy, *only* in cases where the occupation or source of poison is specified and it is indicated that the poison was absorbed as a result of occupation; or the characteristic lesions are superficially located or accessible to direct inspection; or there is chemical or microscopic proof of the presence of poison within the body.

⁶ A reliable statement of cause of death, without autopsy, *only* when the source of the poison is specified, or when there is chemical or microscopic proof of the presence of the poison within the body.

⁷ An unreliable statement of cause of death, without autopsy, unless death occurred in an epileptic attack and was witnessed, and there was a previous history of epilepsy.

⁸ An unreliable statement of cause of death, without autopsy, unless accompanied by a statement of primary cause or of the character of exudate obtained by paracentesis.

⁹ A reliable statement of cause of death, without autopsy, if there is an accompanying statement of the site of the lesion or name of the vessel or vessels involved.

1. DETAILED INTERNATIONAL LIST — *Continued.*IV. DISEASES OF THE RESPIRATORY SYSTEM
— *Con.*

- 94. Pulmonary congestion, pulmonary apoplexy.¹
- 95. Gangrene of the lung.*
- 96. Asthma.
- 97. Pulmonary emphysema.*
- 98. Other diseases of the respiratory system (tuberculosis excepted).

V. DISEASES OF THE DIGESTIVE SYSTEM.

- 99. Diseases of the mouth and annexa.*
- 100. Diseases of the pharynx.*
- 101. Diseases of the esophagus.*
- 102. Ulcer of the stomach.
- 103. Other diseases of the stomach (cancer excepted).
- 104. Diarrhea and enteritis (under 2 years).*
- 105. Diarrhea and enteritis (2 years and over).
- 106. Ankylostomiasis.²
- 107. Intestinal parasites.³
- 108. Appendicitis and typhlitis.
- 109. Hernia and intestinal obstruction.
 - (a) Hernia.⁴
 - (b) Intestinal obstruction.⁵
- 110. Other diseases of the intestines.
- 111. Acute yellow atrophy of the liver.*
- 112. Hydatid tumor of the liver.
- 113. Cirrhosis of the liver.*
- 114. Biliary calculi.*
- 115. Other diseases of the liver.
- 116. Diseases of the spleen.
- 117. Simple peritonitis (nonpuerperal).
- 118. Other diseases of the digestive system (cancer and tuberculosis excepted).

VI. NONVENEREAL DISEASES OF THE GENITO-URINARY SYSTEM AND ANNEXA.

- 119. Acute nephritis.
- 120. Bright's disease.*
- 121. Chyluria.*
- 122. Other diseases of the kidneys and annexa.
- 123. Calculi of the urinary passages.*

VI. NONVENEREAL DISEASES OF THE GENITO-URINARY SYSTEM AND ANNEXA — *Con.*

- 124. Diseases of the bladder.*
- 125. Diseases of the urethra, urinary abscess, etc.*
- 126. Diseases of the prostate.*
- 127. Nonvenereal diseases of the male genital organs.*
- 128. Uterine hemorrhage (nonpuerperal).
- 129. Uterine tumor (noncancerous).*
- 130. Other diseases of the uterus.*
- 131. Cysts and other tumors of the ovary.
- 132. Salpingitis and other diseases of the female genital organs.
- 133. Nonpuerperal diseases of the breast (cancer excepted).*

VII. THE PUERPERAL STATE.*

- 134. Accidents of pregnancy.*
- 135. Puerperal hemorrhage.*
- 136. Other accidents of labor.*
- 137. Puerperal septicemia.*
- 138. Puerperal albuminuria and convulsions.*
- 139. Puerperal phlegmasia alba dolens, embolus, sudden death.*
- 140. Following childbirth (not otherwise defined).*
- 141. Puerperal diseases of the breast.*

VIII. DISEASES OF THE SKIN AND OF THE CELLULAR TISSUE.

- 142. Gangrene.⁶
- 143. Furuncle.⁶
- 144. Acute abscess.⁶
- 145. Other diseases of the skin and annexa.*

IX. DISEASES OF THE BONES AND OF THE ORGANS OF LOCOMOTION.

- 146. Diseases of the bones (tuberculosis excepted).*
- 147. Diseases of the joints (tuberculosis and rheumatism excepted).*
- 148. Amputations.
- 149. Other diseases of the organs of locomotion.

¹ Pulmonary congestion is considered a reliable statement of cause of death, without autopsy, only when the cause is specified; as, for example, *accidental inhalation of irritating fumes*, or accompanying lesions which are known to lead to congestion of the lungs.

² A reliable statement of cause of death, without autopsy, *provided* the infectious parasite *ankylostoma duodenale* or its ova have been demonstrated.

³ A reliable statement of cause of death, without autopsy, *only* with the demonstration of the parasite or its ova in the tissues or discharges.

⁴ A reliable statement of cause of death if the hernia is external, or is exposed on operation or autopsy, when internal; also, when conditions adequate to cause death, together with type and location of hernia, are specified.

⁵ An unreliable statement of cause of death unless the obstruction is demonstrated on autopsy, or operation, or is accessible by examination through the body orifices.

⁶ A reliable statement of cause of death, without autopsy, *if* there is an accompanying statement of the site and nature of the original infection.

1. DETAILED INTERNATIONAL LIST — *Concluded.*

X. MALFORMATIONS.*

150. Congenital malformations (stillbirths not included).*
- (a) Hydrocephalus.*
 - (b) Congenital malformations of the heart.*
 - (c) Other congenital malformations.*

XI. EARLY INFANCY.

151. Congenital debility, icterus and sclerema.
- (a) Premature birth.*
 - (b) Congenital debility, "atrophy," "marasmus," etc.
152. Other causes peculiar to early infancy.
- (a) Injuries at birth.*
 - (b) Other causes peculiar to early infancy.
153. Lack of care.*

XII. OLD AGE.

154. Senility.

XIII. EXTERNAL CAUSES.

155. Suicide by poison.¹
156. Suicide by asphyxia.²
157. Suicide by hanging or strangulation.*
158. Suicide by drowning.*
159. Suicide by firearms.*
160. Suicide by cutting or piercing instruments.*
161. Suicide by jumping from high places.*
162. Suicide by crushing.*
163. Other suicides.*
164. Poisoning by food.³
165. Other acute poisonings.
166. Conflagration.*
167. Burns (conflagration excepted).*

XIII. EXTERNAL CAUSES — *Con.*

168. Absorption of deleterious gases (conflagration excepted).*
169. Accidental drowning.*
170. Traumatism by firearms.⁴
171. Traumatism by cutting or piercing instruments.⁴
172. Traumatism by fall.*
173. Traumatism in mines and quarries.*
- (a) Traumatism in mines.*
 - (b) Traumatism in quarries.*
174. Traumatism by machines.*
175. Traumatism by other crushing.*
- (a) Railroad accidents and injuries.*
 - (b) Street-car accidents and injuries.*
 - (c) Automobile accidents and injuries.*
 - (d) Injuries by other vehicles.*
 - (e) Landslide and other crushing.*
176. Injuries by animals.*
177. Starvation.*
178. Excessive cold.*
179. Effects of heat.*
180. Lightning.*
181. Electricity (lightning excepted).*
182. Homicide by firearms.*
183. Homicide by cutting or piercing instruments.*
184. Homicide by other means.*
185. Fractures (cause not specified).
186. Other external violence.

XIV. ILL-DEFINED DISEASES.

187. Ill-defined organic disease.
188. Sudden death.
189. Not specified or ill-defined.
- (a) Ill-defined.
 - (b) Not specified or unknown.

¹ A reliable statement of cause of death, without autopsy, if the character of the solid or liquid is specified.

² A reliable statement of cause of death, without autopsy, if the character of the gas is specified.

³ An unreliable statement of cause of death without supporting data as to a group of accompanying cases or the ingestion of the particular poisonous substances.

⁴ An unreliable statement of cause of death without supporting data, such as site and extent of injury.

2. ABRIDGED INTERNATIONAL LIST.

The following table shows each title of the Abridged International List. The numbers of the titles of the Detailed International List included in each title of the abridged list appear in parentheses.

Abridged Int. List Number	CAUSE OF DEATH.
1. Typhoid fever (1).*	
2. Typhus fever (2).*	
3. Malaria (4).	
4. Smallpox (5).*	
5. Measles (6).*	
6. Scarlet fever (7).*	
7. Whooping cough (8).*	
8. Diphtheria and croup (9).*	
9. Influenza (10).	
10. Asiatic cholera (12).*	
11. Cholera nostras (13).	
12. Other epidemic diseases (3, 11, 14, 15, 16, 17, 18, 19).	
13. Tuberculosis of the lungs (28, 29).	
14. Tuberculous meningitis (30).	
15. Other forms of tuberculosis (31, 32, 33, 34, 35).	
16. Cancer and other malignant tumors (39, 40, 41, 42, 43, 44, 45).	
17. Simple meningitis (61).	
18. Cerebral hemorrhage and softening (64, 65).	
19. Organic diseases of the heart (79).*	
20. Acute bronchitis (89).	
21. Chronic bronchitis (90).*	
22. Pneumonia (92).	
23. Other diseases of the respiratory system (tuberculosis excepted) (86, 87, 88, 91, 93, 94; 95, 96, 97, 98).	
24. Diseases of the stomach (cancer excepted) (102, 103).	
25. Diarrhea and enteritis (under 2 years) (104).*	
26. Appendicitis and typhlitis (108).	
27. Hernia, intestinal obstruction (109).	
28. Cirrhosis of the liver (113).*	
29. Acute nephritis and Bright's disease (119, 120).	
30. Noncancerous tumors and other diseases of the female genital organs (128, 129, 130, 131, 132).	
31. Puerperal septicemia (puerperal fever, peritonitis) (137).*	
32. Other puerperal accidents of pregnancy and labor (134, 135, 136, 138, 139, 140, 141).*	
33. Congenital debility and malformations (150, 151).	
34. Senility (154).	
35. Violent deaths (suicide excepted) (164, 165, 166, 167, 168, 169, 170, 171, 172, 173, 174, 175, 176, 177, 178, 179, 180, 181, 182, 183, 184, 185, 186).	
36. Suicide (155, 156, 157, 158, 159, 160, 161, 162, 163).*	
37. Other diseases (20, 21, 22, 23, 24, 25, 26, 27, 36, 37, 38, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 62, 63, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 80, 81, 82, 83, 84, 85, 99, 100, 101, 105, 106, 107, 110, 111, 112, 114, 115, 116, 117, 118, 121, 122, 123, 124, 125, 126, 127, 133, 142, 143, 144, 145, 146, 147, 148, 149, 152, 153).	
38. Unknown or ill-defined diseases (187, 188, 189).
